# Selected Abstracts

## Editor's Note

These abstracts are prepared by the author of each article. Each journal editor, where we have an abstracting agreement, is responsible for instructing the author according to our style sheet. These editors are responsible, additionally, for sending these abstracts to the *Journal of Economic Literature*. Only a minimal amount of copy editing is done on these abstracts; thus the reader should turn to the author of the abstract and not this journal if an error of fact or phrasing arises.

Note: The limit of 100 words for abstracts is being strictly enforced; i.e., longer abstracts are not printed.

**Beilock, Richard P.; Polopolus, Leo C. and Correal, Mario**—Ranking of Agricultural Economics Departments by Citations

Ranking of agricultural economics departments based upon the number of articles or article pages does not take into account the impact or usefulness of these journal articles or other works to the profession. In this paper an alternative ranking scheme is employed, which utilizes citations from a broad array of publications of a department's faculty. Rankings are developed for agricultural economics units at 1862 land grant universities, 1890 land grant universities, independent U.S. universities, and Canadian universities, as well as an overall composite ranking and comparisons with economics departments. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 595-604. University of Florida.

**Bordo, Michael D. and Landau, Daniel**—Advocacy and Neo Classical Economics

This paper explores the contradiction between the neoclassical assumption that individuals are rational maximizers and the economist's role as a policy advocate. The issue is studied in the writings of George Stigler and Milton Friedman. Consideration of information costs allows the logical contradiction to be reduced to an empirical question. *Economic J.*,

Apr.-June 1986, 12(2), pp. 94-102. University of South Carolina; University of Connecticut.

**Giersch, Herbert**—Economics as a Public Good

These are recollections of a West German economist who has become increasingly convinced over the years that economics can be conceived and supplied as a public good. For individual expectations and for group behavior to become more rational, the public needs orientation: relevant information about the role of flexible relative prices in open markets for goods, factors, and currencies. Interest groups, including governments, tend to oppose open advice for shortsighted reasons. In the long run, applied economics can well prevail in the market of ideas. *Banca Naz. Lavoro Quart. Rev.*, Sept. 1986, (158), pp. 251-73. University of Kiel, Institut für Weltwirtschaft.

**Grubel, Herbert G. and Boland, Lawrence A.**—On the Efficient Use of Mathematics in Economics: Some Theory, Facts and Results of an Opinion Survey

Mathematics is considered to be an input into the production of human and knowledge capital in economics. The competitive and the interest group models are analyzed as to their predictions about the efficient use of this input. Many stylized facts are found to be consistent with the interest group model and the implication of an excess use of mathematics. Mathematics in journal articles is shown to have grown significantly during the postwar years. In a survey

250 economists express the view that there is too much mathematics in professional journals. Only a minority of respondents rejects the view that interest group behavior is taking place. *Kyklos*, 1986, 39(3), pp. 419-42. Simon Fraser University.

**Hacken, Richard D.**—Scandinavian Social Economics since 1930: A Bibliographic Note

As a sequel to an article on Scandinavian social economics (1850-1930) in the October, 1983 issue of the same journal, this bibliographic paper lists a selection of monographs published since 1930 on the subject. Achievements and failings of social democracy in Sweden, Norway, and Denmark are accentuated, with less attention to titles of theoretical interest. Areas represented are: laboring classes, industry, trade union and labor relations, agriculture, the cooperative movement, socialism, and general and miscellaneous treatises on social economics. *Rev. Soc. Econ.*, Oct. 1986, 44(2), pp. 159-77. Brigham Young University.

**Hogarth, Robin M. and Reder, Melvin W.**—Perspectives from Economics and Psychology: Editors' Comments

The paradigm of rational choice provides economics with a unity that is lacking in psychology. In the study of choice behavior, the two disciplines differ concerning: (1) scope of phenomena: unlike economists, psychologists do not restrict research primarily to the market-level behavior of appropriately motivated experts; (2) object of study: whereas psychologists deem process important, economists concentrate on outcomes; and (3) data considered relevant: aggregate price-quantity relations are the focus of economic enquiry. Psychologists, on the other hand, are interested in different types of individual process data. Despite these differences, points of contact are indicated where each discipline could benefit from considering the alternative perspective. *J. Bus.*, Pt. 2, Oct. 1986, 59(4), pp. S185-207. University of Chicago.

**Pope, Rulon D. and Hallam, Arne**—A Confusion of Agricultural Economists?—A Professional Interest Survey and Essay

A random survey of members of the American Agricultural Economics Association is used to

examine basic philosophical issues regarding the discipline of agricultural economics. In comparison to other studies of economists, much more diversity of response is found among agricultural economists. The data suggest important correlates between the pattern of responses and socioeconomic variables. Some variables that affect responses are agricultural interests, age, school of graduation, area of specialization, and employment. Self-interest, information differences, and empathy are among the possible explanations of the patterns of responses. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 572-94. Brigham Young University; Iowa State University.

#### 012 Teaching of Economics

**Schout, Richard P. M. and Slangen, Louis H. G.**—The Individual Study System in Teaching General and Agricultural Economics: Methodology and Results

General economics and, more particularly, agricultural economics can be fruitfully applied to the agricultural sector. Students of agricultural economics can benefit from knowledge of the general economic theory, not only because of the links between the theories, but also because of the growing interrelatedness of agriculture with the rest of the economy. Combination of these courses has the advantage of clearly showing these relations. Experience at Wageningen Agricultural University proved that the Individual Study System is an appropriate form for these courses. *Europ. Rev. Agr. Econ.*, 1986, 13(1), pp. 107-22. Agricultural University, Wageningen, the Netherlands.

#### 020 GENERAL ECONOMIC THEORY

**Debreu, Gerard**—Theoretic Models: Mathematical Form and Economic Content

Changes in the mathematical form of theoretic models of an economy during the past four decades and the growth of mathematical economics in that period are considered in relation to each other and to the development of the Econometric Society. The fit of the mathematical form to the economic content of theoretic models, their separation in a completed axiomatic theory, and their interplay in its elaboration, are examined. Consequences of the axiomatization of economic theory are analyzed.

*Econometrica*, Nov. 1986, 54(6), pp. 1259-70. University of California, Berkeley.

**Lucas, Robert E., Jr.—Adaptive Behavior and Economic Theory**

This essay uses a series of examples to illustrate the uses of rationality and adaptation in economic theory. It is argued that these hypotheses are complementary, and that stability theories based on adaptive behavior may help to narrow the class of empirically interesting equilibria in certain economic models. An experiment is proposed to test this idea. *J. Bus.*, Pt. 2, Oct. 1986, 59(4), pp. S401-26. University of Chicago.

**021 General Equilibrium and Disequilibrium Theory**

**Aumann, Robert J. and Drèze, Jacques H.—Values of Markets with Satiation or Fixed Prices**

In markets with satiation, competitive equilibria may fail to exist because the satiation points of some traders may be in the interiors of their budget sets. Thus some traders will use less than the maximum budget, creating an excess that may be divided among all traders as dividends. The authors prove that, when there are many individually insignificant agents, every Shapley value allocation is generated by a system of dividends and prices in which all dividends are nonnegative and monotonically depend only on the net trade sets of the agents, not their utilities. The same result holds for markets with fixed prices. *Econometrica*, Nov. 1986, 54(6), pp. 1271-1318. Hebrew University; CORE, Louvain, Belgium.

**Costrell, Robert M.—Equilibrium and Optimality in a Mean-Variance Model**

This article reexamines an old debate over the optimality of market allocations in a symmetric mean-variance world, with production nonconvexities, imperfectly correlated outputs, and free entry. The author shows that Walrasian equilibrium does not exist; that non-Walrasian equilibrium under price-taking behavior allocates resources optimally between the risky and risk-free sectors, but spreads resources in the risky sector over an insufficient number of activities; and that non-Walrasian equilibrium under

consistent conjectures allocates insufficient resources to the risky sector, and spreads them over an excessive number of activities. These results have analogues in the theory of product differentiation. *Rand. J. Econ.*, Spring 1986, 17(1), pp. 122-32. University of Massachusetts.

**Duffie, Darrell—Stochastic Equilibria: Existence, Spanning Number, and the 'No Expected Financial Gain from Trade' Hypothesis**

Stochastic equilibria under uncertainty with continuous-time security trading and consumption are demonstrated in a general setting. Given a fixed economy and equilibrium allocation, for each set of probability assessments there exist equilibrium security prices with no expected financial gains from trade under the given probability assessments. The spanning number of the economy is defined as the fewest number of security markets required to sustain a dynamically complete markets equilibrium, and is characterized one plus the martingale multiplicity of the information structure. Examples are given in which the spanning number is finite even though the number of potential states of the world is infinite. *Econometrica*, Sept. 1986, 54(5), pp. 1161-83. Stanford University.

**Gagey, Frédéric; Laroque, Guy and Lollivier, Stefan—Monetary and Fiscal Policies in a General Equilibrium Model**

In the short run, if price expectations are inelastic, the government has full control of the nominal interest rate. While the model is purely competitive, the conclusions are similar to those of the standard IS-LM analysis. In the long run, it is argued that the proper measure of the government deficit is not the usual one. The interests lost by the money holders because of the transactions constraint must be included as an additional government income, the seigniorage tax. *J. Econ. Theory*, Aug. 1986, 39(2), pp. 329-57. Institut National de la Statistique et des Etudes Economiques, Paris.

**Mas-Colell, Andreu—The Price Equilibrium Existence Problem in Topological Vector Lattices**

A price-equilibrium existence theorem is proved for exchange economies whose con-

sumption sets are the positive orthant of arbitrary topological vector lattices. The motivation comes from economic applications showing the need to bring within the scope of equilibrium theory commodity spaces whose positive orthant has empty interior, a typical situation in infinite dimensional linear spaces. *Econometrica*, Sept. 1986, 54(5), pp. 1039-53. Harvard University.

Nguyen, Trien T. and Whalley, John—Equilibrium under Price Controls with Endogenous Transactions Costs

In this paper the authors present an equilibrium model for an exchange economy with fixed prices and endogenously determined search or transactions costs. Given the fixed prices, endogenously determined equilibrium buying and selling prices (which include transactions costs) result. These costs occur on either the demand or supply side of each market, but not both. An eventual application of this approach to an evaluation of welfare costs of either economy-wide wage and price controls, or sector-specific price controls such as energy is seen. In the final section, some simple numerical examples that illustrate the approach are presented. *J. Econ. Theory*, Aug. 1986, 39(2), pp. 290-300. University of Waterloo; University of Western Ontario, London, Ontario.

## 022 Microeconomic Theory

Abel, Andrew B.—Capital Accumulation and Uncertain Lifetimes with Adverse Selection

Adverse selection in the private annuity market causes the rate of return on private annuities to be less than the actuarially fair rate based on population average mortality. However, compulsory social security is immune to adverse selection and can offer the actuarially fair rate of return based on population average mortality. Because social security offers a higher rate of return than private annuities, consumers cannot offset social security by transacting in the private annuity market. Introducing social security reduces the steady state rate of return on annuities and raises the steady state aggregate bequests and consumption of young consumers. *Econometrica*, Sept. 1986, 54(5), pp. 1079-97. University of Pennsylvania.

Admati, Anat R. and Pfleiderer, Paul—A Monopolistic Market for Information

The authors analyze a model where traders buy information from a monopolistic seller, which is subsequently used in a speculative market. In order to overcome the dilution in the value of information due to its leakage through informative prices, the seller of information may prefer to sell noisier versions of the information he actually has. Moreover, to obtain higher profits, it is desirable for the seller to sell different signals to different traders, so that the added noise realizations do not affect equilibrium prices. One way of doing so, which does not require discrimination, is to sell identically distributed personalized signals to each of a large number of traders. *J. Econ. Theory*, Aug. 1986, 39(2), pp. 400-438. Stanford University.

Artus, Patric and Migus, Bernard—Dynamique de l'investissement et de l'emploi avec coûts d'ajustement sur le capital et le travail. (Investment and Employment Dynamics with Adjustment Costs on Capital and Labour.)

This article presents the foundations and the estimation of two models describing how firms determine the optimal expected paths of employment and of the capital stock when they face adjustment costs on both production factors. In the first model, firms are assumed to be always constrained on their sales; in the second one never to be rationed on the goods market. *Ann. Econ. Statist.*, Apr./June 1986, (2), pp. 75-99 (French). Bank of France; ENSAE, Malakoff, France.

Arvan, Lanny—Sunk Capacity Costs, Long-run Fixed Costs, and Entry Deterrence under Complete and Incomplete Information

This article considers a three-stage, extensive-form game where capacity, once installed, is sunk but where fixed costs are not sunk. The author shows that there may be multiple perfect equilibria of the complete information game. When the entrant is completely informed about the incumbent's cost, the entrant may use the incumbent's capacity choice as a signal of the incumbent's cost. An example is presented where the incumbent prefers a noninformative

capacity signal, since this has the effect of reducing the scale of entry. A second example is presented where the entrant is incompletely informed because the incumbent makes a choice over production technologies that is unobservable to the entrant. *Rand J. Econ.*, Spring 1986, 17(1), pp. 105-21. University of Illinois.

**Beher, Victor A.**—La inflexibilidad descendente de los precios y la teoría de la empresa (Price Inflexibility and the Theory of the Firm)

Downward inflexibility of nominal prices is an established fact of contemporary economic reality; it is responsible for some important phenomena in the behavior of market economies. In this paper reasons for the existence of such inflexibility are analyzed. It is found out that such behavior takes place in those markets where suppliers are pricesetters and where, besides, some of the usual assumptions of microeconomic theory do not hold. The main conclusion is the need of expanding current theory in order to take into consideration the asymmetric behavior, which characterizes monetary prices in contemporary economy. *Económica*, Jan.-Apr. 1985, 31(1), pp. 3-19 (Spanish). National University of La Plata, Argentina.

**Betan-court, Roger R.**—The Duration of Operations and the Estimation of Substitution Possibilities

In this paper a simple procedure is presented to allow the estimation of substitution possibilities in the presence of variations in the duration of operations. The result is applicable to any production function consistent with a classical cost function. *Europ. Econ. Rev.* Dec. 1986, 30(6), pp. 1189-95. University of Maryland.

**Bond, Eric W.**—The Effect of Used Markets with Endogenous Replacement of Durable Goods

This paper examines the optimal retirement age and trading time for durable goods with heterogeneous buyers. It is shown that the presence of used markets leads to a uniform retirement age for all durable goods, but the average replacement rate may either rise or fall relative to that without used markets. This differs from previous models in which used mar-

kets must lengthen the life of durables. Conditions are derived under which restrictions on used markets (either taxes or outright bans) will cause the demand for new goods to fall. *Southern Econ. J.*, Oct. 1986, 53(2), pp. 422-31. Pennsylvania State University.

**Boyer, Marcel and Moreaux, Michel**—Rationnement, anticipations rationnelles et équilibres de Stackelberg (Rationing, Rational Expectations and Stackelberg Equilibria)

The authors consider a Stackelberg-like duopoly in which the strategy space of the firms are price-quantity pairs; meaning that, at this price, a firm is willing to sell at most the supplied quantity. It is shown that, at the equilibrium, the leader will quote a price lower than the price quoted by the follower and that, at the price he quotes, he will ration his demand. Hence, the result is market structure in which price rigidities and persistent excess demand are immediate outcomes of the noncompetitive behavior of some agents. *Ann. Econ. Statist.*, Jan.-Mar. 1986, (1), pp. 55-73 (French). University of Montreal; GREMAQ, University of Social Sciences of Toulouse.

**Brown, Donald**—Increasing Returns and the Share Economy

Under imperfect competition, profit maximization by firms results in the market price exceeding the marginal cost of production; Martin Weitzman terms this "excess supply." Weitzman wishes to replicate in the cost function (in terms of labor) the properties of the revenue function (in terms of output), thus generating "excess demand" for labor. A revenue-sharing scheme will achieve this if, and only if, there are decreasing returns to scale. Hence, increasing returns apparently play no role in Weitzman's analysis. *J. Compar. Econ.*, Dec. 1986, 10(4), pp. 454-56. Yale University.

**Bucovetsky, Sam and Chilton, John**—Concurrent Renting and Selling in a Durable-Goods Monopoly under Threat of Entry

This article analyzes the choice of contract (sales or rental) of a durable-goods monopolist facing a threat of future entry. Although in the absence of such a threat a monopolist would prefer to rent his entire output, the authors

show that the threat of entry alters that preference. There is an optimal preentry contract mix, involving both rental and sales. If both firms behave as Cournot duopolists after entry, the optimal choice of preentry contracts enables the erstwhile monopolist to gain the same profits as he would if he behaved as a von Stackelberg leader. *Rand J. Econ.*, Summer 1986, 17(2), pp. 261-75. University of Western Ontario; University of South Carolina.

**Champsaur, Paul and Rochet, Jean-Charles**—Concurrence par les prix et variété des produits (Price Competition and Product Variety)

The literature provides two polar explanations for the variety of products or qualities offered on the market. Either this variety results from the number of firms, each of which supplies a single product or quality. Or else there is a monopoly offering a variety of products, that is, choosing its catalogue of goods in order better to exploit the diversity of its clientele. This article is a contribution to the development of an intermediary approach permitting an analysis of oligopoly situation without any a priori restriction on the variety of products by the individual firm. *Ann. Econ. Statist.*, Jan.-Mar. 1986, (1), pp. 153-73 (French). Direction de la Prévision, Paris; CEREMADE, University of Paris IX.

**Cooper, Thomas E.**—Most-Favored-Customer Pricing and Tacit Collusion

This article examines the role of the most-favored-customer pricing policy as a practice facilitating coordination in a dynamic model of price-setting duopoly. This policy is a promise by a firm that if it later lowers price, it will rebate to current customers the difference between the price they pay now and the lower future price. By reducing each firm's incentive to reduce price, the policy enables both firms to offer higher prices and to enjoy higher profits. Consequently, at least one firm offers the policy in equilibrium. These general results are illustrated in an example. *Rand J. Econ.*, Autumn 1986, 17(3), pp. 377-88. University of Florida.

**Dana, Rose-Anne and Montuocchio, Luigi**—Dynamic complexity in Duopoly Games

The authors discuss the occurrence of periodic and chaotic phenomena in infinite horizon duopoly games where firms maximize their discounted sum of profits and use Markov perfect equilibrium strategies. In the alternating case their corresponding actions are then constrained orbits of a map similar to a Cournot tâtonnement. It is shown that any behavior is possible for small discount factors and that one obtains the Cournot tâtonnement as the discount factor goes to zero. In the simultaneous case, it is shown by means of an example that many Cournot tâtonnements can be viewed as Markov perfect equilibria of an infinite horizon game and that one obtains the Nash equilibrium of the static game as the discount parameter goes to zero. The authors are thus led to study in detail the dynamical properties of a Cournot tâtonnement. *J. Econ. Theory*, Oct. 1986, 40(1), pp. 40-56. University of Paris VI; Politecnico di Torino, Italy.

**Davidson, Carl and Deneckere, Raymond**—Long-run Competition in Capacity, Short-run Competition in Price, and the Cournot Model

In this article the authors investigate the nature of equilibrium in markets in which firms choose the scale of operation before they make pricing decisions. A duopoly model in which firms choose their capacities before engaging in Bertrand-like price competition is analyzed. It is demonstrated that the Cournot outcome is unlikely to emerge in such markets and that the equilibrium tends to be more competitive than the Cournot model would predict. In addition, the results indicate a tendency toward asymmetric firm sizes and price dispersion that results from the mixed strategies firms use in equilibrium. *Rand J. Econ.*, Autumn 1986, 17(3), pp. 404-15. Michigan State University; Northwestern University.

**Dekel, Eddie**—An Axiomatic Characterization of Preferences under Uncertainty: Weakening the Independence Axiom

The independence axiom used to derive the expected utility representation of preferences over lotteries is replaced by requiring only convexity, in terms of probability mixtures, of indifference sets. Two axiomatic characterizations

are proven, one for simple measures and the other continuous and for all probability measures. The representations are structurally similar to expected utility, and are unique up to a generalization of affine transformations. First order stochastic dominance and risk aversion are discussed using a method which finds an expected utility approximation to these preferences without requiring differentiability of the preference functional. *J. Econ. Theory*, Dec. 1986, 40(2), pp. 304-18. Harvard University.

**Demange, Gabrielle—Free Entry and Stability in a Cournot Model**

In a Cournot model for a single homogeneous good, the author studies simultaneously two stability properties of a Cournot equilibrium: the stability of a continuous quantity adjustment process with a fixed number of firms and the stability relative to entry. Under usual assumptions, it is shown that these two properties are consistent—i.e., there exists an equilibrium that is stable in both senses—and the number of active firms are determined quite sharply. *J. Econ. Theory*, Dec. 1986, 40(2), pp. 283-303. Laboratoire d'Econometrie de l'Ecole Polytechnique, Paris.

**Demange, Gabrielle and Ponsard, Jean-Pierre—Barrière de mobilité et concurrence dans un duopole. Essai de formalisation dans le cadre de la théorie des jeux (Barriers to Mobility and Competition in a Duopoly: An Attempt to Formalize within the Context of Game Theory)**

This article takes the following question as a point of departure: if one firm is more efficient than a rival, does it have cause to initiate a price war? In order to study the question, the authors rely on a simple duopoly model and try to make especially heavy use of the concept of barrier to mobility. They are able to show that such factors as relative cost positions, size and degree of market power as well as global elasticity of demand play an important role. Some early results concerning the role of time are obtained on the basis of a comparative static analysis. *Ann. Econ. Statist.*, Jan.-Mar. 1986, (4), pp. 35-53 (French). Laboratoire d'Econometrie de l'Ecole Polytechnique, Paris; CNRS.

**Dowrick, Steve—Von Stackelberg and Cournot Duopoly: Choosing Roles**

Under what circumstances will firms agree on the choice of roles of leader and follower in the von Stackelberg duopoly model? A key determinant is the slope of the firms' reaction functions (in either price or quantity space). The duopolists will disagree over the choice of roles if they have downward-sloping reaction functions. Each will prefer to be the leader. They will also disagree if they have upward-sloping reaction functions and similar profit functions. Each will prefer that the other be the leader. Preferences between von Stackelberg and Cournot outcomes are also considered. *Rand J. Econ.* Summer 1986, 17(2), pp. 251-60. Australian National University.

**Dye, Ronald A.—Optimal Monitoring Policies in Agencies**

This article considers a principal-agent problem in which the principal has access to a cost monitoring technology that can be used to acquire additional information about the agent's actions subsequent to observing the agent's output. Although randomized monitoring policies are feasible, the author shows that in a variety of contexts optimal monitoring policies are deterministic and "lower-tailed." That is, there exists some critical level of output such that further investigation of the agent's actions occurs if, and only if, output falls below this critical level. *Rand J. Econ.*, Autumn 1986, 17(3), pp. 339-50. Northwestern University.

**Epple, Dennis—Hedonic Prices and Implicit Markets: Estimating Demand and Supply functions for Differentiated Products**

In choosing the level of quality to purchase, the buyer of a differentiated product also chooses a point on the marginal price schedule for that product. Hence, in general, the demand functions for product characteristics cannot be consistently estimated by ordinary least squares. Market equilibrium results in a matching of characteristics of demanders and suppliers. This matching restricts the use of buyer and seller characteristics as instruments when estimating demand and supply functions for product characteristics. The paper develops these issues. A stochastic structure for hedonic

equilibrium models is then proposed, identification results are presented, and estimation procedures are outlined. *J. Polit. Econ.*, Feb. 1987, 95(1), pp. 59-80. Carnegie-Mellon University.

**Fershtman, Chaim and Muller, Eitan**—Capital Investments and Price Agreements in Semicollusive Markets

The authors consider a semicollusive market where firms compete in a long-run variable, such as investment in capital or capacity, and collude with respect to a short-run variable, such as price or market shares. The concern is with the potential destabilizing effect of the long-run competition on the short-run collusion. It is shown that under a certain refinement of the equilibrium, the set of equilibria is reduced to include just the one in which the collusive agreement is stable. Some support is lent to the phenomenon of an inverse association between advertising and competition by investigating the conditions under which overcapitalization occurs in the above equilibrium. *Rand J. Econ.*, Summer 1986, 17(2), pp. 214-26. Hebrew University.

**Franke, Reiner**—Some Problems Concerning the Notion of Cost-Minimizing Systems in the Framework of Joint Production

The paper is concerned with the issue of production prices and the underlying notion of equilibrium in linear joint production systems with technical choice. Conditions are stated (without proof) that ensure the existence of such a cost-minimizing system. In particular, the roles of negative prices and of costly disposal are discussed. Finally, the wage-profit frontier is defined in this framework and an example is given exhibiting a peculiarity of a new type. *Manchester Sch. Econ. Soc. Stud.* Sept. 1986, 54(3), pp. 298-307. University of Bremen, West Germany.

**Frayssé, Jean**—Existence des équilibres de Cournoti un tour d'horizon. (Existence of a Cournot Equilibrium: A Survey)

This paper surveys results on existence of a Cournot equilibrium in a partial equilibrium framework, with a particular attention to recent research on large markets. The literature offers

a large number of formulations. All of them are not covered, but the author thinks that the strong cases studied give a correct idea of the results and the methods of proof. These methods use fixed-point theorems for noncontinuous mappings or nonconvexvalued correspondences; they are expounded in appendix. *Ann. Econ. Statist.*, Jan./Mar. 1986, (1), pp. 9-33 (French). GREMAQ, University of Social Sciences of Toulouse.

**Fujita, Masahisa and Thisse, Jacques-François**—Spatial Competition with a Land Market: Hotelling and Von Thunen Unified

The authors introduce into the standard spatial competition model the consumption of land by households. The spatial distribution of households is treated as endogenous, and a land market is introduced on which households compete for land-use. Households consume simultaneously land and firms' output. Accordingly, the demand of each household becomes, in turn, endogenous as it depends on the income left after the land rent is paid. The results obtained within this more general framework prove to be very different from the standard results. *Rev. Econ. Stud.*, Oct. 1986, 53(5), pp. 819-41. University of Pennsylvania; University of Pennsylvania and CORE.

**Furth, Dave**—Stability and Instability in Oligopoly

For regular oligopolies (both homogeneous and heterogeneous) the (local) Cournot-Nash equilibria are the (nondegenerate) critical points of a Morse-Smale vector field, defined on the feasible region of nonnegative prices and outputs. When at the boundary of this feasible region this vector field points inward, it follows from the Morse inequalities that there is at least one stable equilibrium. When there is a unique, nonstable, interior equilibrium, necessarily the vector field points outward somewhere along the boundary of the feasible region. This raises to a stable boundary equilibrium. *J. Econ. Theory*, Dec. 1986, 40(2), pp. 197-228. University of Amsterdam.

**Gaynor, Martin**—Misperceptions, Moral Hazard and Incentives in Groups

are proven, one for simple measures and the other continuous and for all probability measures. **Gaynor, Martin—Misperceptions, Moral Hazard and Incentives in Groups**

Recent work has shown that, in the presence of moral hazard, balanced-budget Nash equilibria in groups are not Pareto-optimal. This work shows that when agents misperceive the effects of their actions on the joint outcome there exists a set of sharing rules which balance the budget and lead to a Pareto-optimal Nash equilibrium. *Managerial Dec. Econ.*, Dec. 1986, 7(4), pp. 279-82. State University of New York at Binghamton.

**Hassin, Refael**—Consumer Information in Markets with Random Product Quality: The Case of Queues and Balking

The author considers a revenue-maximizing server who has the opportunity to suppress information on actual queue length, leaving demanders to decide on joining the queue on the basis of the known distribution of waiting times. The following second best problem is addressed: if suppression, but not pricing, can be socially controlled, it is socially optimal to prevent suppression? It is shown that it may be, but is not always, socially optimal to prevent suppression, and that it is never optimal to encourage suppression when the revenue maximizer prefers to reveal the queue length. *Econometrica*, Sept. 1986, 54(5), pp. 1185-95. Tel-Aviv University.

**van den Heuvel, Paul**—Nonjoint Production and the Cost Function: Some Refinements

R. E. Hall (1973) gives characterizations of a nonjoint technology in terms of the technology's input requirements sets and in terms of its cost functions. Hall's theorems are reconsidered and an improvement is obtained in the formulations. It is shown that a restatement is needed, especially with respect to the cost function theorem, in order to avoid misunderstandings. Furthermore, a local version of nonjoint production is formulated. *J. Econ. (Z. National-ökon.)*, 1986, 46(3), pp. 283-97. Netherlands Bank, Amsterdam.

**Hobbs, Benjamin F.**—Mill Pricing versus Spatial Price Discrimination under Bertrand and Cournot Spatial Competition

This paper asks two questions about spatial competition. First, does spatial price discrimination lead to higher profits than mill pricing? Second, does spatial price discrimination lead to higher consumer surplus than mill pricing?

than mill pricing? If firms hold the Bertrand conjecture, the answer is yes for most values of fixed cost. But for the Cournot conjecture, the opposite is true. Second, does the introduction of space into the oligopoly models of Bertrand and Cournot change their results? The answer is generally no; however, spatial Bertrand prices exceed marginal cost, unlike their spaceless counterparts. These answers are obtained using models of spatial competition, of which the Cournot mill pricing models are new. *J. Ind. Econ.*, Dec. 1986, 35(2), pp. 173-91. Case Western Reserve University.

**Judd, Kenneth L. and Petersen, Bruce C.**—Dynamic Limit Pricing and Internal Finance

This paper examines a model of dynamic limit pricing with a profit-maximizing fringe constrained to finance new investment from internal finance. In a differential game, the dominant firm controls price, thereby determining the current earnings of the fringe, while the fringe chooses its optimal retention ratio. If market growth is less than the discount rate, an important feature of the solution is that price must eventually drop to the fringe long-run cost of production. If market growth is initially rapid, the dominant firm is much more aggressive in limiting fringe growth. *J. Econ. Theory*, Aug. 1986, 39(2), pp. 368-99. Northwestern University.

**Kahneman, Daniel; Knetsch, Jack and Thaler, Richard**—Fairness and the Assumptions of Economics

Public standards of fairness for the behavior of firms were studied and their possible economic consequences are explored. Evidence of resistance to unfairness is presented: people are willing to incur costs to avoid a transaction in which they are treated unfairly. The existence of such attitudes in customer and labor markets could provide an incentive for profit-maximizing firms to behave in accordance with standards of fairness. Survey results indicate that it is unfair for firms to exploit an increase in their market power, but acceptable for them to maintain current profits by raising prices and for unprofitable firms to lower wages. Judgments of fairness are susceptible to framing effects. *American Economic Review*, May 1986, 76(2), pp. 255-79. Four papers in this issue.

tions about market phenomena are drawn from the rules of fairness. *J. Bus.*, Pt. 2, Oct. 1986, 59(4), pp. S285-300. University of British Columbia; Simon Fraser University; Cornell University.

**Kolstad, Charles D. and Wolak, Frank A.—**  
Conjectural Variation and the Indeterminacy of Duopolistic Equilibria

The purpose of this article is to investigate the basic premise that the various oligopoly models result in an unacceptable divergence in market equilibria. In the first half of the paper a theoretical model of a static conjectural variation duopoly with symmetric costs is presented. Using this model, the authors define the coefficient of dispersion of equilibria and show that it is solely a function of the basic conditions of the market—costs and demand. This result is of empirical significance because it is possible to determine *ex ante*, from easily observable information, the extent to which conjectural variation (market conduct) will influence market equilibrium. *Can. J. Econ.*, Nov. 1986, 19(4), pp. 656-77. University of Illinois; Stanford University.

**Kubo, Yuji—**Quality Uncertainty and Guarantee: A Case of Strategic Market Segmentation by a Monopolist

This paper presents a monopoly model with product quality uncertainty in which an optional quality guarantee is used to effectively segment the monopolist's potential market and price-discriminate among consumers having different incomes. The optional guarantee pricing is seen to dominate pure monopoly pricing, either with tied-in guarantee or no guarantee in terms of maximum expected profits. In the optional guarantee equilibrium, the monopolist captures a larger part of this potential market by charging a lower price for an unguaranteed product and a higher price for a guaranteed product, than does either of the pure monopoly solutions. *Europ. Econ. Rev.*, Oct. 1986, 30(5), pp. 1063-79. University of Tsukuba, Ibaraki-Ken, Japan.

**Laband, David N.—**Stoplight Sales and Sidewalk Solicitations: Some Simple Economics of Forced Consumption

The so-called "squeegee kids" who wash the windshields of motorists stopped by a red light in exchange for a "donation" are a recent innovation in stoplight vendors. The social mores of value in exchange for value and desire to remove extortion elements motivate motorists to pay the youngsters. The welfare and distributional effects of stoplight sales as a joint product involving provision of a service and extortion are examined in this paper. The argument is then extended to certain types of charitable appeals that also employ the value in exchange for value mechanism and elements of extortion to generate donations in excess of those that would be realized from a purely charitable appeal. *J. Econ. Behav. Organ.*, Dec. 1986, 7(4), pp. 403-14. Clemson University.

**Lambert, Richard A.—**Executive Effort and Selection of Risky Projects

This article examines the incentives of executives to adopt risky projects. The agency problem considered is that of motivating the executive to expend effort to generate information about the profitability of projects and to select the "best" project conditional upon the information that his effort generates. The author shows that the executive and the principal will not always agree regarding which project is best. Conditions are provided under which this conflict of interest leads (from the principal's perspective) to either an underinvestment or an overinvestment in risky projects. *Rand J. Econ.*, Spring 1986, 17(1), pp. 77-88. University of Pennsylvania.

**Lau, Lawrence J. and Ma, Barry K.—**Choice of Technique in a Putty-Clay Model of Production

The choice of technique with uncertain prices is analyzed. Under expected profit maximization (and, hence, risk neutrality) and gamma-distributed prices, the optimal technique is shown to be the same as that of certainty equivalence at the means if, and only if, the *ex ante* production function is of the Cobb-Douglas form with the parameters determined completely by the parameters of the gamma distributions. This result provides an example of the inconsistency of the certainty equivalence argument in general even with risk neu-

trality. *Eastern Econ. J.*, July-Sept. 1986, 19(3), pp. 321-26. Stanford University; McGill University.

**Luton, Richard A. and McAfee, R. Preston**—Sequential Procurement Auctions

Two auctions are held in sequence with the possibility of learning between the second and the first. The buyer optimally chooses to discriminate against the winner of the first auction in the second. The optimal mechanism has a discontinuity in the winner's second bid; this strictly dominates a sequence of independent sealed bid auctions. *J. Public Econ.*, Nov. 1986, 31(2), pp. 181-95. University of Western Ontario, London, Ontario.

**Magill, Michael J. P. and Nermuth, Manfred**—On the Qualitative Properties of Futures Market Equilibrium

This paper studies the qualitative properties of a model of futures market equilibrium. The authors characterize the bias (backwardation or contango) in the futures price, the extent to which output is hedged by producers, and the output that is produced relative to the case of no uncertainty. They show that only three cases can arise, and give precise conditions under which these three cases arise when the number of speculators is very large. The conditions involve the nature of the stochastic dependence between the spot price and the random returns that speculators earn on markets in the rest of the economy. *J. Econ. (Z. Nationalökon.)*, 1986, 46(3), pp. 233-52. University of Southern California; University of Bielefeld, West Germany.

**Mak, King-Tim**—On Separability: Functional Structure

C. J. Bliss' notion of nonstrict separability is shown to be the most general, yet practical, formulation of separability. This paper extends the classic theory of strict separability to non-strict separability. W. M. Gorman's basic theorem for overlapping strictly separable groups of variables is generalized. With the generalized basic theorem on hand, Gorman's procedure for deducing functional structures can be extended for deducing the internal structure of a wider class of economic systems modeled by continuous functions. The generalized basic

theorem also prepares for the joint characterization of the additively separable and Leontief functional forms. *J. Econ. Theory*, Dec. 1986, 40(2), pp. 250-82. University of Illinois at Chicago.

**Malcomson, James M.**—Rank-Order Contracts for a Principal with Many Agents

For a principal with many agents, rank-order contracts remain incentive compatible even when information about agents' performance is known only to the principal because the total payment from the principal to all agents taken together is independent of the outcome that occurs. Under wider conditions than those considered previously in the literature, there is shown to exist a rank-order-contract equivalent, exactly or approximately, to any (nonlinear) piece-rate contract. Under those conditions, therefore, results that depend on the unenforceability of piece rates under such asymmetric information disappear if rank-order contracts can be used. *Rev. Econ. Stud.*, Oct. 1986, 53(5), pp. 807-17. University of Southampton.

**Mankiw, N. Gregory and Whinston, Michael D.**—Free Entry and Social Inefficiency

Previous articles have noted the possibility of socially inefficient levels of entry in markets in which firms must incur fixed set-up costs upon entry. This article identifies the fundamental and intuitive forces that lie behind these entry biases. If an entrant causes incumbent firms to reduce output, entry is more desirable to the entrant than it is to society. There is therefore a tendency toward excessive entry in homogeneous product markets. The rules of product diversity and the integer constraint on the number of firms are also examined. *Rand J. Econ.*, Spring 1986, 17(1), pp. 48-58. Harvard University.

**Martin, Robert E.**—Quality Choice under Labor-Management

The theory of quality choice and the profit-maximizing firm is rather well developed. The theory of quality choice and the labor-managed firm remains largely unexplored. The purpose of this paper is to develop a quality choice model that leads to: (1) comparisons between the labor-managed firm and the profit-maximiz-

ing firm and (2) the effect of market structure per se on the quality choice of the labor-managed firm. *J. Compar. Econ.*, Dec. 1986, 10(4), pp. 400-413. Louisiana State University.

**McAfee, R. Preston and McMillan, John**—Bidding for Contracts: A Principal-Agent Analysis

This article models the process of bidding for government contracts in the presence of moral hazard. Several (possible risk-averse) potential contractors (agents) submit sealed bids, on the basis of which the government (principal) selects one to perform a task. The optimal linear contract is derived. The bidding process induces the potential agents to reveal their relative expected costs. The optimal contract trades off giving the chosen agent an incentive to limit costs against stimulating bidding competition and sharing risks. The optimal contract is never cost-plus, may be fixed-price, but is usually an incentive contract. Some prescriptions for government contracting emerge. *Rand J. Econ.*, Autumn 1986, 17(3), pp. 326-38. University of Western Ontario.

**Michel, Philippe**—Dynamique de l'accumulation de capital en présence de contraintes de débouchés (A Dynamic Analysis of Capital Accumulation with Expected Demand Constraints)

There are different formulations of capital inertia based on costs of adjustment. The differences in the results derive essentially from the returns to scale of the revenue function relating production and costs. Based on an example, the author studies two questions bearing on the role of the anticipated constraints: the lag between the application of a constraint and the diminution of investments, and the influence of fluctuations in demand on investment decisions. *Ann. Econ. Statist.*, Apr./June 1986, (2), pp. 117-45 (French). University of Paris-I.

**Okuguchi, Koji**—Labor-Managed Bertrand and Cournot Oligopolies

The equilibrium prices for output-adjusting labor-managed Cournot oligopoly under product differentiation and those for price-adjusting Bertrand oligopoly are compared. The global stability condition for the Bertrand equilibrium

prices ensures that the Cournot equilibrium prices are not lower than the Bertrand equilibrium prices. *J. Econ. (Z. Nationalökon.)*, 1986, 46(2), pp. 115-22. Tokyo Metropolitan University.

**Plott, Charles R.**—Rational Choice in Experimental Markets

The theory of rational behavior has several different uses: (1) it is used at the most fundamental level of experimental methodology to induce preferences used as parameters in models; (2) it appears repeatedly in experimentally successful mathematical models of complex phenomena such as speculation, bidding and signaling; (3) it is used as a tool to generate *ex post* models of results that are otherwise inexplicable; and (4) it has been used as a tool to successfully design new institutions to solve specific problems. When tested directly the theory can be rejected. It is retained because neither an alternative theory nor an alternative general principle accomplishes so much. *J. Bus.*, Pt. 2, Oct. 1986, 59(4), pp. S301-27. California Institute of Technology.

**Raut, Lakshmi Kanta**—Myopic Topologies on General Commodity Spaces

Continuity of preferences imposes behavioral restrictions on the preferences such as impatience or myopia. This paper extends the different notions of myopia due to D. J. Brown and L. M. Lewis, and their characterization of the Mackey topology in terms of myopia, from  $L_\infty$  to  $L_\infty$ . Then this characterization of the Mackey topology on  $L_\infty$  is used to extend Araujo's theorem on the necessity of impatience for the existence of competitive equilibrium from  $L_\infty$  to  $L_\infty$ . *J. Econ. Theory*, Aug. 1986, 39(2), pp. 358-67. World Bank.

**Russell, Allen M.; Rickard, John A. and Howroyd, T. D.**—The Effects of Delays on the Stability and Rate of Convergence to Equilibrium of Oligopolies

The stability of oligopolies is investigated using the Cournot strategy and a general output adjustment procedure. Information delays are incorporated into the adjustment procedure and their specific effects upon the dynamic stability of oligopolies is investigated. The stability

of equilibrium for discrete models is unaffected by information delays and remoteness of planning horizons. For continuous models with delays, some restraints are required for stability. *Econ. Rec.*, June 1986, 62(177), pp. 194-98. University of Melbourne; University of Melbourne; University of New Brunswick, Canada.

**Sakai, Yasuhiro**—Cournot and Bertrand Equilibria under Imperfect Information

This paper investigates a duopoly model (under both the Cournot and the Bertrand behavioral assumptions) with differentiated products under imperfect information that stems from uncertainty associated with the (possibly different) demand/cost structures facing the two firms. Focus is on assessing the combined force of physical and stochastic interactions between those firms. It is shown that the shared information structure is generally better than the private information structure for duopolists. Intermediate cases include the possibility that unilateral transmission of information always benefits the sender, but might hurt the receiver. The findings under the Cournot and Bertrand assumptions are then compared. *J. Econ. (Z. Nationalökon.)*, 1986 46(3), pp. 213-32. University of Tsukuba, Ibaraki, Japan.

**Sengupta, Jati K.**—Optimal Monopolistic Strategy under Demand Uncertainty

The objective of this paper is two-fold: to analyze the implications of using inventories in the behavioral modes of the monopolistic strategy and to derive a dynamic decision rule when the monopolist is strictly risk averse and there is parametric uncertainty in the demand function. *J. Econ. (Z. Nationalökon.)*, 1986, 46(2), pp. 101-13. University of California, Santa Barbara.

**Simon, Herbert A.**—Rationality in Psychology and Economics

The assumption that actors maximize subjective expected utility (economic rationality) supplies only a small part of the premises in economic reasoning, and that often not the essential part. The remainder of the premises are auxiliary empirical assumptions about actors' attitudes, beliefs, expectations, and the like. Making these assumptions correctly requires

an empirically founded theory of choice that specifies what information decisionmakers use and how they actually process it. This behavioral empirical base is largely lacking in contemporary economic analysis, and supplying it is essential for enhancing the explanatory and predictive power of economics. *J. Bus.*, Pt. 2, Oct. 1986, 59(4), pp. S209-24. Carnegie-Mellon University.

**Spulber, Daniel F.**—Second-Best Pricing and Cooperation

This article studies pricing for natural monopolies by using a cooperative game of joint production. Outputs are allocated by a price system. The author introduces the concept of the second-best core, which is a subset of the set of zero-profit, second-best Pareto-optimal prices. Prices are such that no group of consumers subsidizes the purchase of another group. The relations among the second-best core and sustainability, supportability, and natural monopoly are considered. For specific preferences and technology, the existence of the second-best core is demonstrated. A market mechanism for franchise allocation, which achieves second-best pricing without price regulation, is designed. *Rand J. Econ.*, Summer 1986, 17(2), pp. 239-50. University of Southern California.

**Vislie, Jon**—Joint Production and Market Structure: The Case of Oil and Natural Gas

This paper is concerned with joint production and mixed market structure, where one commodity is traded according to a contract established between the seller and a buyer, determined as a Nash bargaining solution, and the other commodity is traded at a world market at a given price. Such a model describes the market for natural gas in Western Europe, which is very much like a bilateral oligopoly. Some properties of the gas contract are derived and the resourceowner's optimal oil production, given those contract rules, is determined. The exogenous oil price plays a crucial role. *J. Econ. (Z. Nationalökon.)*, 1986, 46(2), pp. 163-73. University of Oslo.

**Zeira, Joseph**—Investment as a Process of Search

This paper analyzes optimal capital accumulation in the face of "structural uncertainty," in which the firm does not fully know its own profit function, and it can discover it only through further investment. It is shown that under structural uncertainty capital accumulation is gradual even when adjustment costs are linear and not convex. It is further shown that structural uncertainty creates an incentive to market research. The paper also presents an example of structural uncertainty in which an additional price uncertainty has a negative effect on investment, contrary to the standard models. *J. Polit. Econ.*, Feb. 1987, 95(1), pp. 204-10. Hebrew University, Jerusalem.

### 023 Macroeconomic Theory

Azariadis, Costas and Guesnerie, Roger—Sunspots and Cycles

Because sunspot equilibria seem to be of central importance for an understanding of rational expectations, the authors seek to characterize completely a limited class of sunspot equilibria (stationary ones with two possible natural events) in the simplest overlapping generations model of production. They present a sufficient condition for the existence of stationary sunspot equilibria, examine how these are related to strictly periodic equilibria of the same order, and investigate how deterministic stationary equilibria bifurcate to stationary sunspot equilibria. *Rev. Econ. Stud.*, Oct. 1986, 53(5), pp. 725-37. University of Pennsylvania; EHESS and ENPC, Paris.

Blinder, Alan S.—Keynes after Lucas

This paper argues that intellectual resources in macroeconomics have been misallocated during the past ten to fifteen years. The Keynesian consensus, as it existed in the United States around 1972, is contrasted with the new classical approach. It is argued that, except in a few respects (e.g., more serious modeling of expectations), the latter is not an obvious improvement over the former. It is further argued that the parts of the Keynesian model that were questioned least by new classical critics (e.g., the LM curve) may be the weakest links in the chain. Hence there remains an important Keynesian research agenda. *Eastern Econ. J.*, July-Sept. 1986, 12(3), pp. 309-16. Princeton University.

Cukierman, Alex and Meltzer, Allan H.—A Theory of Ambiguity, Credibility, and Inflation under Discretion and Asymmetric Information

The paper develops a positive theory of credibility, ambiguity, and inflation under discretion and asymmetric information. The monetary policymaker maximizes his own, politically motivated, objective function. The importance he assigns to objectives shifts stochastically through time. These shifts give rise to asymmetries in information. Expectations are rational, but information is imperfect because control procedures are imprecise. The public becomes aware of persistent changes in policymaker's objectives gradually. Credibility is defined in terms of the speed with which the public learns about policy changes. Ambiguous control procedures are shown to benefit the policymaker who wants to stimulate. *Econometrica*, Sept. 1986, 54(5), pp. 1099-1128. Tel-Aviv University; Carnegie-Mellon University.

Davidson, Paul—The Simple Macroeconomics of a Nonergodic Monetary Economy versus a Share Economy: Is Weitzman's Macroeconomics Too Simple?

L. Weitzman's share economy model achieves full employment as a result of his assumptions of the perishability of *all* goods plus an intemporal Say's Law, rather than his analysis. Without an investment sector, only government spending is autonomous and, hence, the sole source of instability. Finally, assuming the capital-labor ratio was initially greater than zero, Weitzman's analysis of a conversion of a money wage system to a share system requires employers to reduce the capital labor ratio to zero, thereby reducing the productivity of labor and its real wage toward zero. *J. Post Keynesian Econ.*, Winter 1986-87, 9(2), pp. 212-25. University of Tennessee, Knoxville.

Dutt, Amitava Krishna—Wage Rigidity and Unemployment: The Simple Diagrammatics of Two Views

There are two main views regarding the relation between involuntary unemployment and wage rigidity. The mainstream view is that unemployment is caused by wage rigidity and the dissident view is that unemployment would in-

crease with reduced wage rigidity, and wage rigidity may in fact be the response to unemployment. This paper provides a simple comparison of the two views employing the commonly used diagrammatic tools of aggregate demand and supply curves. *J. Post Keynesian Econ.*, Winter 1986-87, 9(2), pp. 279-90. Florida International University, Miami.

Fazzari, Steven M. and Mott, Tracy L.—The Investment Theories of Kalecki and Keynes: An Empirical Study of Firm Data, 1970-1982

This paper estimates an investment model based on the work of Michal Kalecki and John Maynard Keynes using a large sample of U.S. manufacturing firm data. The theory emphasizes the level of expected sales relative to existing capacity and the ability of firms to generate internal and external financing as determinants of investment. Sales, internal cash flow, and interest expense variables perform well in the estimated equation. The results strongly indicate an effect of financial variables on investment that is independent from the conventional sales or output effects. *J. Post Keynesian Econ.*, Winter 1986-87, 9(2), pp. 171-87. Washington University, St. Louis; University of Colorado, Boulder.

Geanakoplos, J. D. and Polemarchakis, H. M.—Walrasian Indeterminacy and Keynesian Macroeconomics

Overlapping generations models with or without production or a portfolio demand for money display a fundamental indeterminacy. Expectations matter, and are not, in the short run, constrained by the hypotheses of agent optimization, rational expectations, and market clearing. In this framework of perfect foresight and market clearing prices, it is possible to make Keynesian assumptions about the rigidity of money wages and the exogeneity of "animal spirits" of investors and to derive Keynesian conclusions about the short-run effectiveness of policy. Alternatively, starting from different but no less rational expectations, one can derive the "new classical" neutrality propositions. *Rev. Econ. Stud.*, Oct. 1986, 53(5), pp. 755-79. Yale University; Columbia University.

Guesnerie, Roger—Stationary Sunspot Equilibria in an  $N$  Commodity World

This article considers one-step forward looking economic systems, whose dynamics are governed by nonlinear relationships between prices today and prices tomorrow. Attention is focused on a category of rational expectations equilibria, stationary sunspot equilibria correlated with a 2-states exogenous Markov process (2-SSE). Theorem 1 provides a sufficient existence condition only involving the characteristics of the deterministic stationary equilibrium (DTS). Theorem 2 exhibits connections between multiple deterministic equilibria and semitrivial SSE. Theorems 3-4 show that 2-SSE close to the DTS have characteristics relating to those of the stable manifold of the deterministic system. *J. Econ. Theory*, Oct. 1986, 40(1), 103-27. Centre d'Economie Quantitative et Comparative, EHESS, Paris.

Hargreaves Heap, Shaun P.—Risk and Culture: A Missing Link in the Post Keynesian Tradition

Power and uncertainty are two central and distinguishing concepts in post-Keynesian economic analysis. A recent book by Mary Douglas and Aaron Wildavsky links these two concepts in new and interesting ways. This paper sketches and amends these proposed links, and suggests how they might contribute to the development of the post-Keynesian tradition. The principal, general contribution is that uncertainty is no longer regarded as some independent source of social explanation. Instead, uncertainty becomes a condition that expands the domain of influence of the power relations in a society, as reflected in its choice of institutions. *J. Post Keynesian Econ.*, Winter 1986-87, 9(2), pp. 267-78. University of East Anglia, Norwich, England.

Helliwell, John F.—Supply-Side Macroeconomics

This paper tests new classical and Keynesian theories of output within an encompassing model in which producers choose the utilization rate for employed inputs. Data for Canada, the United States, and several other major industrial countries reject the Keynesian, new classical, and unstructured VAR models in favor of

the highly structured factor utilization model. *Can. J. Econ.*, Nov. 1986, 19(4), pp. 597-625. University of British Columbia.

**Hercowitz, Zvi**—The Real Interest Rate and Aggregate Supply

This paper analyzes the effects of the anticipated real interest rate on aggregate supply variables, in a model where time-to-produce and variable capital utilization play a crucial role. The potential importance of the present mechanism for business cycle theory lies in its ability to generate positive co-movements of employment, capital utilization, labor productivity, output, and investment. These variables are predicted to be affected negatively by the real interest rate. Reduced forms for output and employment are derived and tested with Canadian data, taking estimates of the real interest rate prevailing in the United States as the relevant exogenous price. *J. Monet. Econ.*, Sept. 1986, 18(2), pp. 121-45. Tel-Aviv University and University of Western Ontario, London, Ontario.

**Howitt, Peter**—The Keynesian Recovery

Although modern macroeconomic analysis has almost immortalized Keynes's IS-LM framework, it has largely ignored the central message of the *General Theory*. This is attributable at least in part to Keynes's failure to provide a clear conception of market organization as an alternative to the Walrasian auction paradigm. Recent developments, however, in the theory of search and transaction externalities may ultimately provide that missing conception. Also, work on indeterminacy in rational expectations models may direct the profession's attention away from wage stickiness and back toward the intertemporal coordination problems that Keynes saw as lying at the root of unemployment. *Can. J. Econ.*, Nov. 1986, 19(4), pp. 626-41. University of Western Ontario.

**Howitt, Peter**—Wage Flexibility and Employment

Keynes's *General Theory* contains two propositions concerning wages and employment. First, wage reductions reduce employment. Second, increased wage flexibility makes employment more variable. This paper examines

both propositions in a rational expectations macro model. The first proposition is valid under the conditions postulated by Keynes. The second tends to be confirmed because of an expectations multiplier that makes employment more responsive to demand or wage shocks the more flexible are wages. Specifically, an increase in employment causes wages to begin rising; the anticipation of that rise causes a secondary increase in aggregate demand and employment. *Eastern Econ. J.*, July-Sept. 1986, 12(3), pp. 237-42. University of Western Ontario.

**van de Klundert, Theo C. and Peters, Peter J.**—Tax Incidence in a Model with Perfect Foresight of Agents and Rationing in Markets.

This paper examines the incidence of several taxes in a macroeconomic model. Producers and consumers optimize with perfect foresight. Price inertia leads to rationing in the market for goods and for labor. In the long run, the system tends toward Walrasian equilibrium. Meanwhile, there may be a Keynesian unemployment, classical unemployment or repressed inflation, with possible switches of regimes. Balanced budget policies are analyzed by working through numerical examples. *J. Public Econ.*, June 1986, 30(1), pp. 37-59. Tilburg University, the Netherlands; Nijmegen University, the Netherlands.

**Mirón, Jeffrey A.**—Seasonal Fluctuations and the Life Cycle-Permanent Income Model of Consumption

This paper examines a new possible explanation for the recent rejections of the life cycle-permanent income model of consumption: the treatment of seasonal fluctuations. The paper shows that when the seasonal fluctuations in consumption purchases are included in an analysis of the life cycle-permanent income model, there is no evidence in the aggregate data against the model. The estimates of the parameters of agents' utility functions obtained with seasonally unadjusted data are plausible, and the unadjusted data do not reject the overidentifying restrictions on the model. *J. Polit. Econ.*, Dec. 1986, 94(6), pp. 1258-79. University of Michigan.

**Nordhaus, William**—Can the Share Economy Cure Our Macroeconomic Woes? Probably Not

This paper investigates the question of whether a share economy would lead to "excess demand for labor," that is, to a tilt toward higher vacancies and lower unemployment than those of a wage economy. It argues that a key theorem in Martin Weitzman's argument rests on a dubious assumption about labor supply behavior. Once more conventional labor supply assumptions are introduced, the share economy tends to behave much like a wage economy and many of the more striking claims for the share economy seem unjustified. *J. Compar. Econ.*, Dec. 1986, 10(4), pp. 448-53. Yale University.

**Rabin, Alan and Keilany, Ziad**—A Note on the Incompatibility of the Pigou Effect and a Liquidity Trap

This article demonstrates that a serious inconsistency exists in the literature regarding the discussion of the liquidity trap and the Pigou effect. More specifically, the macro literature, as well as most textbooks, first assumes that the economy is in a liquidity trap and then stipulates that the Pigou effect could "rescue" the economy by increasing the demand for commodities, and, therefore, real income. However, if the economy were truly in a liquidity trap, as assumed in the literature, then a Pigou effect could not occur. For the liquidity trap precludes the presence of such an effect. *J. Post Keynesian Econ.*, Winter 1986-87, 9(2), pp. 291-96. University of Tennessee.

**Rothschild, Kurt W.**—Is There a Weitzman Miracle?

M. L. Weitzman has put forward a model of an economy in which the wage system is replaced by a system of profit sharing agreements. It is claimed that the unemployment problems that arise as a consequence of wage rigidity would disappear in a share economy even when the same rigidity in labor contract parameters is assumed. The first part of this paper summarizes Weitzman's ideas. In the second part his ideas are criticized on theoretical and practical grounds. In particular, Weitzman takes too narrow a view of Keynesian

unemployment, neglects the importance of certainty in pay levels, and overlooks the institutional problems of profit sharing arrangements. *J. Post Keynesian Econ.*, Winter 1986-87, 9(2), pp. 198-211. University of Linz, Austria.

**Shapiro, Matthew**—Capital and Saving in a Share Economy

Martin Weitzman is correct in his claim that, in long-run equilibrium, the capital stock will be identical in wage and share systems. But a corollary of Weitzman's excess demand for labor in the short run is that the firm is holding too much capital at any given moment. The reduction in demand for capital goods following a shock might create a new channel for the accelerator. A share system also exposes workers to increased capital risk. *J. Compar. Econ.*, Dec. 1986, 10(4), pp. 444-47. Yale University.

**Solow, Robert M.**—What Is a Nice Girl Like You Doing in a Place Like This? Macroeconomics after Fifty Years

This essay compares the state of macroeconomic theory at the origin with its condition today. It dates the beginning of macrotheory from the publication of the *General Theory* in 1936 and looks at the original state of macroeconomics through the lens of Pigou's *Employment and Equilibrium*, published four years later as a direct response to Keynes. The models underlying those two books are much more like each other than either is like the dominant macrotheory of today. The difference is traced to the diversion of the (reasonable) demand for microfoundations into the (failed) attempt to construct macrotheory on a Walrasian basis. *Eastern Econ. J.*, July-Sept. 1986, 12(3), pp. 191-98. Massachusetts Institute of Technology.

**Zabel, Edward**—Price Smoothing, Inventory and Random Output

This paper considers a multi-period, random demand, random output model to examine properties of price flexibility. A major outcome is to distinguish transient and ergodic states of the system. In stationary conditions when adjustments with respect to an initial position are complete, prices lie within the control bounds of an ergodic set, the price bounds are sensitive to cost parameters and properties of probability

distributions, and price changes smooth variations in inventory caused by demand fluctuations. Considering price responses to changes in the demand structure, however, it may appear that the system responds more quickly to decreases in demand than to increases in demand. *Eastern Econ. J.*, July–Sept. 1986, 12(3), pp. 313–20. University of Florida.

#### 024 Welfare Theory

**Maital, Shlomo**—Prometheus Rebound: On Welfare-Improving Constraints

Every microeconomic decision problem can be framed as the maximization of a function subject to constraints. In the language of mathematics, constraints are regarded as welfare-impairing. In reality, people willingly constrain their own choices in ingenious ways, and appear better off for doing so. This paper argues that some constraints are welfare-improving. Results from experimental and social psychology supporting this idea are cited. Ways of modeling welfare-improving constraints are explored, and credit constraints are discussed as an illustration. *Eastern Econ. J.*, July–Sept. 1986, 12(3), pp. 327–44. Technion Israel Institute of Technology, Haifa.

#### 025 Social Choice

**Stolz, Peter**—Parteienwettbewerb, politisches Kartell und Tausch zwischen sozioökonomischen Gruppen. (Party Competition, Political Cartel and Exchange between Socio-economic Groups)

Party competition forms an important element of the economic theory of politics. Indeed, the author replaces the usual assumption of vote maximization with the seat-maximizing principle. Generally, the competition model can be applied to politics only if due carefulness is observed. Frontiers between differently organized governments may also imply limits to the transfer of this model. The Swiss Confederation is better characterized by the alternative model of a political cartel. Finally, while the competitive model isn't suited for each epoch, the history of a Swiss canton shows the exchange model to be comparatively unaffected by institutional change. *Schweiz. Z. Volkswirtschaft. Statist.*, Dec. 1986, 122(4), pp. 657–75 (German). Bettingen, Switzerland.

#### 026 Economics of Uncertainty and Information; Game Theory and Bargaining Theory

**Bernheim, B. Douglas and Ray, Debraj**—On the Existence of Markov-Consistent Plans under Production Uncertainty

R. Strotz (1956) and R. Pollak (1968) were among the first to study the behavior of an economic agent whose preferences change over time. They suggested that such an agent would choose a "consistent plan." A Markov-consistent plan has a particularly simple structure: current decisions are independent of past decisions, except insofar as past decisions affect the current values of state variables. Unfortunately, Markov-consistent plans do not generally exist. In this paper, the authors demonstrate that the existence problem disappears for finite horizon problems when one introduces even a small amount of smooth uncertainty into production. *Rev. Econ. Stud.*, Oct. 1986, 53(5), pp. 877–82. Stanford University and National Bureau of Economic Research; Stanford University.

**Binmore, Ken; Rubinstein, Ariel and Wolinsky, Asher**—The Nash Bargaining Solution in Economic Modelling

This article establishes the relationship between the static axiomatic theory of bargaining and the sequential strategic approach to bargaining. The authors consider two strategic models of alternating offers. The models differ in the source of the incentive of the bargaining parties to reach agreement: the bargainers' time preference and the risk of breakdown of negotiation. Each of the models has a unique perfect equilibrium. When the motivation to reach agreement is made negligible, in each model the unique perfect equilibrium outcome approaches the Nash bargaining solution with utilities that reflect the incentive to settle and with the proper disagreement point chosen. The results provide a guide for the application of the Nash bargaining solution in economic modeling. *Rand J. Econ.*, Summer 1986, 17(2), pp. 176–88. London School of Economics; Hebrew University; Hebrew University.

**Bray, Margaret M. and Savin, Nathan E.**—Rational Expectations Equilibria, Learning, and Model Specification

In the rational expectations equilibrium of the generalized linear cobweb model the expected price is a linear function of an observable variable. In this paper it is assumed that agents do not know the parameter of this function and estimate it by Bayesian regression. The regression equation is misspecified outside rational expectations equilibrium because agents fail to take account of forecast feedback. Nevertheless, provided supply and demand curves intersect in the usual way, expectations are asymptotically rational. Rates of convergence and divergence and the results of standard tests for model misspecification are studied by computer simulation. *Econometrica*, Sept. 1986, 54(5), pp. 1129-60. University of Cambridge; University of Iowa.

**Eisen, Roland**—Wettbewerb und Regulierung in der Versicherung: Die Rolle asymmetrischer Information (Competition and Regulation in Insurance: The Role of Asymmetrical Information)

In insurance, regulation attempts to achieve two goals: (1) guaranty of continual fulfillment of commitments and (2) equal access to or improved availability of insurance. While the first can be secured by solvency regulation, the second can be attained by premium regulation, compulsory or social insurance. A simple model of a competitive insurance market with asymmetrical information is developed to show that a Nash-Cournot equilibrium may not exist. There are, however, Wilson-reaction equilibria with transfers from good to bad risks. Some qualitative characteristics of these equilibria are analyzed, and it is shown that regulation may lead to welfare improvements. *Schweiz. Z. Volkswirtschaft. Statist.*, Sept. 1986, 122(3), pp. 339-58 (German). Johann-Wolfgang-Goethe University, Frankfurt.

**Forges, Françoise M.**—An Approach to Communication Equilibria

The Nash equilibrium concept may be extended gradually when the rules of the game are interpreted in a wider and wider sense, so as to allow preplay or even intraplay communication. A well known extension of the Nash equilibrium in Aumann's correlated equilibrium, which depends only on the normal form

of the game. Two other solution concepts for multistage games are proposed here: the extensive-form correlated equilibrium and the communication equilibrium. The author shows that the set of payoffs associated with each solution concept has a canonical representation and is a convex polyhedron. *Econometrica*, Nov. 1986, 54(6), pp. 1375-85. CORE, Louvain, Belgium.

**Hellwig, Martin**—Risikoallokation in einem Marktsystem (The Allocation of Risks in the Markets)

For an economy under uncertainty, the fundamental theorems of welfare economics—and hence the principle of laissez-faire—are valid if, and only if, markets are complete. However, information asymmetries and control problems usually preclude the completeness of the market system. The paper discusses the consequences of this observation for: (1) the role of capital markets institutions such as banks in the allocation of investment funds and (2) the role of economic policy for the allocation of risk in the markets. *Schweiz. Z. Volkswirtschaft. Statist.*, Sept. 1986, 122(3), pp. 231-51 (German). University of Bonn.

**Kohlberg, Elon, and Mertens, Jean-François**—On the Strategic Stability of Equilibria

A basic problem in the theory of noncooperative games is the following: which Nash equilibria are strategically stable, i.e., self-enforcing, and does every game have a strategically stable equilibrium? The authors list three conditions that seem necessary for strategic stability—backward induction, iterated dominance, and invariance—and define a set-valued equilibrium concept that satisfies all three of them. It is proved that every game has at least one such equilibrium set. Also, it is shown that the departure from the usual notion of single-valued equilibrium is relatively minor, because the sets reduce to points in all generic games. *Econometrica*, Sept. 1986, 54(5), pp. 1003-37. Harvard University; CORE and Catholic University of Louvain.

**Konakayama, Akira; Mitsui, Toshihide and Watanabe, Shinichi**—Efficient Contracting with Reliance and a Damage Measure

This article reexamines the problem of breach of contract studied by S. Shavell (1980, 1984) and W. P. Rogerson (1984) by considering explicitly the incentive problems that arise from asymmetric information and transaction-specific investment. The authors derive the optimal contract, which consists of variable price and damage payment schedules, each of which is set before any private information is observed. It is shown that the optimal contract attains full classical efficiency. *Rand J. Econ.*, Autumn 1986, 17(3), pp. 450-57. Tokai University; University of Kansas; University of Kansas.

**Middleton, Elliott—Some Testable Implications of a Preference for Subjective Novelty**

A model of the response to subjective novelty represented by the Wundt curve was first informally introduced to economics by Tibor Scitovsky in 1976. Utility depends on how "new" an event is in the subject's experience: highly novel events cause anxiety; moderately novel events are pleasurable; entirely familiar events are boring. The article operationalizes "subjective novelty" for problems where it can meaningfully be described statistically, using information theory. A distinction is drawn between "informational" utility, dependent on experiential context; and "physical" utility as in the standard model. A successful empirical test is performed using a measure of consumer sentiment. *Kyklos* 1986, 39(3), pp. 397-418. Temple University.

**Saari, Donald G. and Williams, Steven R.—On the Local Convergence of Economic Mechanisms**

For certain informationally decentralized economic models, it is known that the associated dynamical process need not be locally stable. In this paper, the causes of the conflict between the local stability of the process and the decentralization of information are identified. This motivates a resolution for this problem. The method describes how approximate, local information about the economy can be used to modify a decentralized, dynamical procedure to achieve local stability. Explicit procedures are given for constructing the decentralized systems with which the agents communicate this approximate information. As

an illustration, this approach provides a partial response to the well known convergence problems with the tâtonnement model. *J. Econ. Theory*, Oct. 1986, 40(1), pp. 152-67. Northwestern University.

**Sutton, John—Non-Cooperative Bargaining Theory: An Introduction**

The paper provides an introduction to the recent literature on "noncooperative" or "sequential" bargaining models. It focuses on the relationship between the new approach and the traditional axiomatic approach exemplified by "Nash bargaining theory." It illustrates the new insights offered by the noncooperative approach, by reference to a detailed analysis of the manner in which the presence of an outside option available to one of the parties will affect the negotiated outcome. Finally, the difficulties that arise in extending this analysis to two-person bargaining with incomplete information, and to  $n$ -person bargaining, are discussed. *Rev. Econ. Stud.*, Oct. 1986, 53(5), pp. 709-24. London School of Economics.

**Tversky, Amos and Kahneman, Daniel—Rational Choice and the Framing of Decisions**

The rational model of expected utility theory is commonly used as a descriptive theory of choice. Its descriptive validity has been challenged by counterexamples, notably the well known Allais and Ellsberg problems. The challenges have evoked attempts at reconciliation. Several normative theories have been proposed, which weaken the rules of rationality to accommodate observed choice behavior. These approaches fail when applied to violations of the rules of invariance and dominance, which are normatively essential but descriptively invalid. Framing effects that induce violations of invariance and dominance are described. *J. Bus.*, Pt. 2, Oct. 1986, 59(4), pp. S251-78. Stanford University; University of British Columbia.

**027 Economics of Centrally Planned Economies**

**Ickes, Barry W.—On the Economics of Taut Plans**

Targets issued to enterprises in centrally planned economies are frequently taut. The literature on tautness has neglected the aggregate

effects of taut plans. Since the outputs of some enterprises are inputs to others, taut plans allow for more intensive use of available resources, but coordination of taut plans is made difficult by incomplete information about the capacity constraints of various enterprises. The author derives an aggregate relationship between the tautness of plans and total output. *J. Compar. Econ.*, Dec. 1986, 10(4), pp. 388-99. Pennsylvania State University.

### 030 HISTORY OF ECONOMIC THOUGHT; METHODOLOGY

#### 031 History of Economic Thought

**Angresano, James**—Gunnar Myrdal as a Social Economist

Based upon the suggested criteria for identifying a social economist, Gunnar Myrdal seems to merit consideration as a member of this approach to economics. Practitioners of social economics are willing to: contribute toward establishing social goals for their society; adopt an interdisciplinary approach to economic issues; attempt to measure and explain existing social values; emphasize an inductive approach to social science; strive to convert economics into political economy; and accept the task of making recommendations for reform and policy. In addition to conforming to the social economist approach, Myrdal should be recognized as a social reformer actively proposing and implementing policy. *Rev. Soc. Econ.*, Oct. 1986, 44(2), pp. 146-58. Hampden-Sydney College, Virginia.

**Ashton, Thomas Southcliffe**—Recollections of Four British Economic Historians

This is the text of a lecture given at the University of Exeter in 1966 in which the late Professor Ashton recounted his memories of his relationship with four distinguished British economic historians of a past generation—Sir William Ashley, professor at Birmingham, George Unwin, professor at Manchester, John L. Hammond, journalist, and R. H. Tawney, professor at the London School of Economics. Arguing that British economic history owed much to scholars who had come from Manchester and its immediate environs, Ashton noted that two of his subjects, Ashley and Unwin, were Mancunians while the other two, Ham-

mond and Tawney, spent a good deal of their working lives in Manchester. The article provides a lively and at times amusing account of these four influential men. *Banca Naz. Lavoro Quart. Rev.*, Sept. 1986, (158), pp. 337-52.

**Buchanan, James M.**—Better than Plowing

This intellectual autobiography traces the development of the central ideas associated with James M. Buchanan's work, and identifies the influences that contributed to this development. Particular emphasis is placed on the influence of Frank Knight and Knut Wicksell and on the early exposure to the Italian literature in public finance theory. *Banca Naz. Lavoro Quart. Rev.*, Dec. 1986, (150), pp. 359-375. George Mason University.

**Elliott, John E.**—On the Possibility of Marx's Moral Critique of Capitalism

This paper assesses, and rejects, the claim that Marx did not, or could not, have a moral critique of capitalism because such a critique does not, or would not, cohere with the rest of his economic theory and social science. Four main themes are examined: (1) the view of an antinomy between fact and value versus Marx's view of their interaction; (2) Marx's sociohistorical perspective; (3) Marx's metaethical ideas on the origins of rights versus his evaluative critique; and (4) "moral theory" versus "moral critique" in Marx's study of capitalism. *Rev. Soc. Econ.*, Oct. 1986, 44(2), pp. 130-45. University of Southern California, Los Angeles.

**Fatton, Robert, Jr.**—Hegel and the Riddle of Poverty: The Limits of Bourgeois Political Economy

This article argues that G. W. F. Hegel's analysis of civil society demonstrated a clear awareness of the antinomies of wealth and poverty generated by capitalism. Hegel was therefore neither an apologist for nor an ideologist of the emerging capitalist order. He failed, however, to solve these antinomies of wealth and poverty because he was a bourgeois political economist. His analysis did not go beyond the confining limits of capitalism and consequently his philosophy lost its critical and dialectical substance. The article also contends that He-

gel's theory of the state is neither totalitarian nor democratic, but rather a call for the concentrated power of the propertied classes in an age when capitalist civilization had yet to establish its full hegemony. *Hist. Polit. Econ.*, Winter 1986, 18(4), pp. 579-600. University of Virginia.

**Leathers, Charles G.—Bellamy and Veblen's "Christian Morals"**

This paper suggests that Thorstein Veblen's concept of "Christian morals" may have been inspired by the treatment of religion in Edward Bellamy's utopian novels. Differences do exist between Veblen's and Bellamy's views on the spiritual aspects of religion. But in sociological terms, Veblen's vision of a natural Christianity of brotherly love suggests Bellamy's "religion of solidarity" modified to comport with Veblen's instinct theory. *J. Econ. Issues*, Dec. 1986, 20(4), pp. 1107-19. University of Alabama.

**Maes, Ivo—Did the Keynesian Revolution Retard the Development of Portfolio Theory?**

The claim is advanced that John Hicks's article "A Suggestion for Simplifying the Theory of Money," published in *Economica* (February 1935), can be considered as a prefiguration of modern macroeconomic portfolio theory. But James Tobin's main contributions date from the mid 1950s onward. How to explain this twenty year gap in the development of portfolio theory? With the rise of the Keynesian revolution, attention became concentrated on the real sector of the economy. The financial and monetary sector did not receive so much attention any more. This is illustrated by a short history of the development of Hicks's thinking on macroeconomic and monetary theory from the mid-1930s till the 1950s. *Banca Naz. Lavoro Quart. Rev.*, Dec. 1986, (159), pp. 407-21. National Bank of Belgium, Brussels.

**McFarland, Floyd B.—Clarence Ayres and His Gospel of Technology**

Clarence Ayres purported to be a follower of Thorstein Veblen, but his central ideas are antithetical to Veblen's. Veblen saw institutions as a connector between sufficient reason and efficient cause and was neither totally Materialist nor Idealist. Ayres was "completely material-

ist," a technological determinist, and wrote an article entitled "The Gospel of Technology." Technology was all productive factors, institutions were only inhibitors of production. This nonfalsifiable tautology assigned Institutionalists the passive role of suggesting marginal institutional changes. Regarding technology as determinative of social change, Ayres was neither radical nor actively reformist, merely an observer of inexorable progress. *Hist. Polit. Econ.*, Winter 1986, 18(4), pp. 617-37. Oregon State University.

**Moss, Laurence S. and Vaughn, Karen L.—Hayek's Ricardo Effect: A Second Look**

This article examines a long-standing controversy in economic thought: the debate over Friedrich A. Hayek's Ricardo Effect. The authors conclude that when defending the thesis that government-managed booms (nearly always) end in crisis, Hayek explored a novel methodological approach. Much was made of the logical consistency of Hayek's mechanism when examined through the lens of comparative statics. Hayek insisted on a market process account of the transition between equilibria and this was not understood. The Keynesian emphasis on balancing flows of expenditure at alternative levels of income did little to encourage interest in Hayek's approach. *Hist. Polit. Econ.*, Winter 1986, 18(4), pp. 545-65. Babson College; George Mason University.

**Negishi, Takashi—Thornton's Criticism of Equilibrium Theory and Mill**

Why J. S. Mill, who recanted wages fund doctrine in his review (1869) of William T. Thornton's *On Labour* (1869), did not change his previous view in his 1871 edition of *Principles* is partly explained by the fact that Mill interpreted Thornton's example of fish auctions wrongly that the equilibrium is not unique. Admitting the possibility of the similar indeterminacy in labor market, Mill recanted the doctrine. Thornton pointed out in 1970, however, that the equilibrium is unique but exchange transactions are carried out at disequilibrium. It was impossible, then, for Mill to follow Thornton to repudiate the equilibrium theory itself. *Hist. Polit. Econ.*, Winter 1986, 18(4), pp. 567-77. University of Tokyo.

**O'Driscoll, Gerald P., Jr.—Money: Menger's Evolutionary Theory**

Carl Menger offered an invisible-hand explanation of the development of money and monetary institutions. Recent work on the micro-foundations of monetary theory heightens the relevance of his microeconomic analysis of money. The recent work has only begun, however, to incorporate some of Menger's insights. Less well known than his methodological writings, Menger's analysis of the origins of money constitutes a fundamental economic contribution. Menger's approach is contrasted with that of the legal restrictions theory of money, which views major features of modern monetary systems as the outcome of governmental intervention. *Hist. Polit. Econ.*, Winter 1986, 18(4), pp. 601-16. Federal Reserve Bank of Dallas.

**Ramstad, Yngve—A Pragmatist's Quest for Holistic Knowledge: The Scientific Methodology of John R. Commons**

This paper establishes that John R. Commons developed and communicated his "institutional economics" in strict conformity with the methodological precepts of "holism." Through textual analysis, it is shown that Commons's conception of reality, the procedures he employed to develop and test his theories, and the process through which he conveyed the structure of those theories all adhered consistently to holistic precepts. Thus, it is argued that the usual assessment of Commons's work as methodologically incoherent is wrong. Nonetheless, it is shown that Commons's holistic mode of "explanation" serves as a formidable barrier to rapid comprehension of his theoretical writings. *J. Econ. Issues*, Dec. 1986, 20(4), pp. 1067-1105. University of Rhode Island.

**Rima, Ingrid H.—The Peculiarities of Labor Markets and the Residuum**

The link between Alfred Marshall's concern about poverty and the Residuum and his analysis of labor market peculiarities is a neglected thread in the development of his work. The change in his treatment of the poverty problem that evidences itself after 1885 is interpreted in the context of Marshall's increased awareness of the necessity for finding new techniques of knowledge acquisition. In particular, he recog-

nized the limitations of transferring the rigorous analytical tools of Book V to things that lie beyond the grasp of the static method. Although, Marshall was prone to address them in moral terms, it is essential that his own caveat be recognized in extending his "engine of analysis" to the study of questions relating to the problem of distribution. *Eastern Econ. J.*, Apr.-June 1986, 12(2), pp. 158-74. Temple University.

**Street, Donald R.—The Authorship of Campomanes' *Discurso sobre el fomento de la industria popular*: A Note**

This paper argues that the essential content of Count Campomanes's book appeared in a previous book, *Discurso sobre el modo de fomentar la industria popular*, by Manuel Rubín de Celis (1774). The book was important because of its anticipation of Adam Smith on several points. Time sequencing, choice of printer, translation backgrounds, and writing style of the authors support Rubín as the true author. Recognition of Rubín as the author brings him to the top rank of eighteenth-century Spanish economists. *Hist. Polit. Econ.*, Winter 1986, 18(4), pp. 655-60. Auburn University.

**Williams, Philip L.—A Reconstruction of Marshall's Temporary Equilibrium Pricing Model.**

Alfred Marshall's discussions of the market period in corn and fish markets illustrate the equilibrium, stability and determinacy of a pure-exchange model. However, a more formal statement of the model exposes two inconsistencies. First, the day is treated both as a point in time and as a real period within which significant action occurs. Second, the discussion of determinacy assumes that supply is merely negative excess demand, which is inconsistent with the asymmetry of demand and supply in the analysis of equilibrium and stability. Maintenance of the assumption of asymmetry will, as stated by P. H. Wicksteed, cause indeterminacy. *Hist. Polit. Econ.*, Winter 1986, 18(4), pp. 639-53. University of Melbourne.

**036 Economic Methodology**

**Dopfer, Kurt—The Historiomic Approach to Economics: Beyond Pure Theory and Pure Experience**

An initial distinction is made between logico-deductive and "empirico"-deductive approaches to economic theory. The logico-deductive approach, uses an axiomatic framework that has little empirical substance. The empirico-deductive approach, states economic theory in terms of a "typical" structure of reality. Both approaches operate within the basic assumption of classical physics that theory must represent an invariant structure of reality—highlighting here economic phenomena that do not change over time. The paper favors instead a "historical" approach that stresses the importance of making theoretical (-nomic) statements about economic phenomena that are basically historical (histo-) in their nonclassical properties of variancy and time-asymmetry. *J. Econ. Issues*, Dec. 1986, 20(4), pp. 989–1010. University of St. Gallen, Switzerland.

**Hirsch, Abraham—Caldwell on Praxeology and Its Critics: A Reappraisal**

Bruce J. Caldwell's use of the distinction between internal and external criticism is questioned and it is argued that recent developments in the philosophy of science leave unscathed the criticisms of the methodology of Ludwig von Mises, which Caldwell considered in his article. The heart of the matter is the position of Mises that neither the premises nor the predictions of economic theory can be or need be tested. From this derives the criticism that praxeology is incomprehensible, dogmatic, and unscientific, criticism which Caldwell fails to refute. *Hist. Polit. Econ.*, Winter 1986, 18(4), pp. 661–68. Brooklyn College.

**Hodgson, Geoff—Behind Methodological Individualism**

While many economists claim to be guided by methodological individualism, consistency and clarity in the use of the term is lacking. Key statements of the doctrine suggest the primacy of individual purposefulness, combined with a failure or refusal to give an adequate account of the formation of purpose itself. It is argued that this position is analytically unacceptable, and from which it appears that the methodological individualist has no satisfactory and consistent line of retreat. The espousal of methodological individualism and other related

doctrines by economists should thus be challenged. *Cambridge J. Econ.*, Sept. 1986, 10(3), pp. 211–24. Newcastle-upon-Tyne Polytechnic.

**Rotwein, Eugene—Flirting with Apriorism: Caldwell on Mises**

This article presents a criticism of the treatment of Ludwig von Mises's apriorism by Bruce Caldwell in his "Praxeology and Its Critics: An Appraisal" (*History of Political Economy*, Vol. 16, no. 3, 1984, pp. 363–80.) It argues that, although Caldwell attempts to give a more balanced evaluation of Mises's apriorism than is found in the views of its critics, his article does not afford any support for Mises's position or weaken the case against it and, moreover, his defense of Mises is inconsistent with his own recognition of the importance of empirical tests of generalizations concerning the relations between matters of fact. *Hist. Polit. Econ.*, Winter 1986, 18(4), pp. 669–73. Queens College, City University of New York.

**040 ECONOMIC HISTORY**

**042 Economic History: United States and Canada**

**Altman, Morris—Resource Endowments and Location Theory in Economic History: A Case Study of Quebec and Ontario at the Turn of the Twentieth Century**

The hypothesis that a region's or nation's lag-gard industrial development can be explained by its relatively more expensive supplies of coal and iron ore is challenged here. A simple model, based on location theory, is developed. Using this model, the author demonstrates the conditions under which this hypothesis holds. A case study of Quebec and Ontario industry suggests that the differential resource cost hypothesis seriously lacks explanatory power. *J. Econ. Hist.*, Dec. 1986, 46(4), pp. 999–1009. University of Ottawa.

**Carlos, Ann M. and Hoffman, Elizabeth—The North American Fur Trade: Bargaining to a Joint Maximum under Incomplete Information, 1804–1821**

The authors examine bargaining between the Northwest Company and the Hudson's Bay Company using recent models of bargaining under incomplete information. Two previously undisturbed bodies of correspondence are ana-

lyzed: letters between the two companies and letters between the Hudson's Bay Company and its London committee. Through merger the companies achieved a joint maximum, but the lengthy and costly bargaining process dissipated much of the potential gain through depletion of animal stocks. Achievement of a joint maximum was hindered by incomplete information, commitment to a strategy that led to bargaining breakdowns, delineation of each party's rights under laws, and environmental changes. *J. Econ. Hist.*, Dec. 1986, 46(4), pp. 967-86. Huron College, Ontario; University of Wyoming.

**Fishback, Price V.**—Did Coal Miners "Owe Their Souls to the Company Store"? Theory and Evidence from the Early 1900s

Although coal companies may have tried to exploit a local-store monopoly, company store prices in nonunion areas were appreciably limited by competition from other stores and mines in the same labor market. Company stores persisted in part by lowering transactions costs. Prices at company stores were generally similar to those at nearby independent stores, and higher wages may have compensated for higher store prices at isolated mines. Conditions varied, however, with labor market tightness. Miners were generally not in debt to the store, nor paid entirely in scrip. Scrip was an advance on payday, when miners received cash. *J. Econ. Hist.*, Dec. 1986, 46(4), pp. 1011-29. University of Georgia.

**Roback, Jennifer**—The Political Economy of Segregation: The Case of Segregated Streetcars

The introduction of segregation laws for municipal streetcars is examined. The economics of private and public segregation is analyzed first, taking note of the particular features of the streetcar industry, followed by a discussion of the contemporary debates on streetcar segregation laws in a number of southern cities. The evidence presented suggests that segregation laws were binding constraints and not simply the codification of customary practice. Furthermore, the streetcar companies were not the initiators of segregation and sometimes actively resisted it. These findings are related to several

major interpretations of the origins of segregation. *J. Econ. Hist.*, Dec. 1986, 46(4), pp. 893-917. George Mason University.

**043 Economic History: Ancient and Medieval (until 1453)**

**Stacey, Robert C.**—Agricultural Investment and the Management of the Royal Demesne Manors, 1236-1240

Between 1236 and 1240 the king's estate steward Walter de Burgo improved the productivity of about forty royal manors by systematically increasing agricultural investment to levels four to five times the medieval average. On estates where he managed the inland directly, de Burgo improved the quality of the draft animals and spent large sums on marling, smother crops, and on the purchase of foreign seed. Within four years he raised the net value of these manors 70 percent, thus demonstrating the direct link that could exist between investment levels and productivity in medieval agriculture. *J. Econ. Hist.*, Dec. 1986, 46(4), pp. 919-34. Yale University.

**044 Economic History: Europe**

**Huberman, Michael**—Invisible Handshakes in Lancashire: Cotton Spinning in the First Half of the Nineteenth Century

In Lancashire cotton spinning in the heyday of laissez-faire capitalism, the labor market did not operate as an auction market. Evidence on piece-rate flexibility, length of tenure, and seniority is consistent with Arthur M. Okun's contract approach. Both workers and firms incurred initial set-up costs. Workers wanted to protect their initial investments in training, and firms, faced with a labor supply that varied in reliability and regularity, had a desire to cover initial hiring and tryout costs. The need to maintain long-term attachments had implications for wage and employment adjustment and the age structure of the labor force. *J. Econ. Hist.*, Dec. 1986, 46(4), pp. 987-98. Trent University, Ontario.

**Hunt, E. H.**—Industrialization and Regional Inequality: Wages in Britain, 1760-1914

This paper describes the geographical pattern of wages in Britain between 1760 and 1914. It then draws out some of the implications of the

wages pattern and considers, in particular, the implications for the "growth pole" debate on the likely effect of industrialization upon regional income inequalities. The market forces responsible for creating and maintaining these differentials are then described, followed by a final section that discusses the significance of changing regional wage differentials to the standard-of-living debate. It concludes that from a regional perspective the overall effects of industrialization upon living standards are indisputably favorable. *J. Econ. Hist.*, Dec. 1986, 46(4), pp. 935-66. London School of Economics

#### 050 ECONOMIC SYSTEMS

##### 051 Capitalist Economic Systems

**Deans, Robert H.**—Macroeconomic Conflicts and Economic and Social Policies

The conflicts of traditional economic and social policies in terms of income and employment goals are creating a crisis in the promotion of the welfare state in OECD countries. Emergence of a coherent policy requires a further look at the social contract option of incomes policy. Major discussion of Martin L. Weitzman's share economy and Steven Plaut's reverse incomes policy are presented as possible avenues to pursue in promoting a solution to the stagflation climate found in many OECD countries. *Rev. Soc. Econ.*, Oct. 1986, 44(2), pp. 113-29. Temple University.

**Mehrling, Perry G.**—A Classical Model of the Class Struggle: A Game-Theoretic Approach

The class struggle is formalized as a differential game in a strictly supply-side model, an approach that synthesizes the models of Kelvin Lancaster and Richard M. Goodwin. Four different steady-state equilibria are derived, each corresponding to different assumptions about the degree to which each class is organized to promote its own interests. In particular, the Goodwin growth cycle is shown to emerge from a world characterized by unorganized capitalists and workers, in which individuals ignore the effects of their own actions on economywide variables. More relevant for discussion of modern capitalism are the hierarchical equilibria, especially the codetermination equilibrium in which the existence of a full-employment equilibrium turns out to be problematic. *J. Polit.*

*Econ.*, Dec. 1986, 94(6), pp. 1280-1303. Harvard University.

**Nordhaus, William D.**—Introduction to the Share Economy

This paper introduces the major ideas in Martin Weitzman's "The Share Economy." It notes that a "share" economy is one in which the marginal cost of labor is less than the average cost of labor; moreover, this condition can be induced by sharing revenues of profits. According to share theory, such contracts will lead firms to create more vacancies and thereby lower the average unemployment rate. Weitzman proposes to induce more share arrangements by giving a tax preference to share-type income. *J. Compar. Econ.*, Dec. 1986, 10(4), pp. 416-20. Yale University.

#### 100 Economic Growth; Development; Planning; Fluctuations

##### 110 ECONOMIC GROWTH; DEVELOPMENT; AND PLANNING THEORY AND POLICY

##### 111 Economic Growth Theory and Models

**Asimakopulos, Athanasios**—Harrod and Domar on Dynamic Economics

There are important differences in the dynamic, Keynesian analyses of Roy Harrod and Evsey Domar. Harrod's is the more general model, with its focus on entrepreneurial equilibrium rates of growth allowing both for consideration of conditions consistent with a steady advance and the changing equilibrium rates of growth over the trade cycle. His instability principle follows naturally from this concern with entrepreneurial responses. Domar's analysis concentrates on the calculation of the rate of growth of investment that would result in the full employment of labor, and it assumes constancy of parameter values over long intervals of time. *Banca Naz. Lavoro Quart. Rev.*, Sept. 1986, (158), pp. 275-86. McGill University.

**Boldrin, Michele and Montuochio, Luigi**—On the Indeterminacy of Capital Accumulation Paths

In neoclassical optimal growth models the stability of the accumulation paths depends on

the discount parameter. The authors prove that, for discount factors small enough, the policy function that describes an optimal path can be of any type. The result is achieved by using the notion of  $\alpha$ -concavity. A constructive approach is adopted. Given any twice differentiable map it is shown how to construct an optimal growth problem that produces that map as the optimal policy function. A consequence is that "chaos" can appear in these models. Bounds on the values of the discount parameter for which "indeterminacy" is possible is also provided. *J. Econ. Theory*, Oct. 1986, 40(1), pp. 26-39. University of Rochester; Polytechnic of Turin, Italy.

**Deneckere, Raymond J. and Pelikan, Steve—Competitive Chaos**

What kinds of dynamic behavior can optimal trajectories in deterministic growth models display? This paper presents examples of economies that have stable equilibrium cycles in consumption, capital, and prices of arbitrary period, as well as of economies that have chaotic equilibrium paths. Some necessary and sufficient conditions for these phenomena to occur are discussed. *J. Econ. Theory*, Oct. 1986, 40(1), pp. 13-25. Northwestern University; University of Cincinnati.

**Elbers, C. and Weddepohl, H. N.—Steady State Equilibria with Saving for Retirement in a Continuous Time Overlapping Generations Model**

This paper studies some simple stationary growth models with continuously overlapping generations, i.e., where consumers are born and die at each moment of time. Two behavioral rules for saving are proposed: (1) a pension scheme where working consumers pay a uniform premium to a pension fund and receive a uniform pension after retirement and (2) the familiar life-cycle model of individual optimization where consumers save (and possibly also dissave, temporarily) during their active period, and dissave after retirement. *J. Econ. (Z. Nationalök.)*, 1986, 46(3), pp. 253-82. University of Amsterdam; Free University, Amsterdam.

**Goodwin, Richard M.—Swinging along the Turnpike with von Neumann and Sraffa**

John von Neumann discovered the theory of the turnpike, using a constant technology and an infinite supply of labor at a constant real wage. Piero Sraffa demonstrated that for a given state of the economy, there could be a real wage ranging from subsistence to total net product. This essay combines these two disparate concepts in a dynamic setting whereby growth and profit rate are first too high and then too low, averaging out to a long-run constant rate with an average real wage that produces a growth rate equal to the combined effects of growth in labor productivity and in labor force, with a dynamical equilibrium, average rate of unemployment. *Cambridge J. Econ.*, Sept. 1986, 10(3), pp. 203-10. University of Siena.

**112 Economic Development Models and Theories**

**Perrings, Charles—Income Redistribution and Labour Surplus in the Classical Theory of Labour Migration**

The results of the Lewis model of the labor-surplus economy depend upon the assumption that there exists a perfectly elastic supply of labor at an institutionally determined real wage. Historical research has shown that the excess supply of labor from the noncapitalist sector in such economies is the outcome of state intervention designed to facilitate high rates of growth in the capitalist sector. This paper examines the link between state intervention in the distribution of income and the existence of a labor surplus in the noncapitalist sector of an integrated "dualistic" economy. *Manchester Sch. Econ. Soc. Stud.*, Sept. 1986, 54(3), pp. 283-97. University of Auckland, New Zealand.

**114 Economics of War, Defense, and Disarmament**

**Ball, Nicole—Converting the Workforce: Defence Industry Conversion in the Industrialised Countries**

Developments in the economics of weapons production have reduced the number of workers that can be profitably employed in the defence industry, creating a need for conversion to the civil sector independently of progress made in arms control negotiations. The author analyzes the situation in respect of the industries and occupations that are most dependent on defense contracting, and discusses the prob-

lems that different groups of defence industry employees encounter in transferring to the civil sector. It is suggested that advance planning, the availability of government programs such as retraining schemes, and flexibility on the part of employees and management are crucial for making these transfers as smooth as possible. *Int. Lab. Rev.*, July-Aug. 1986, 125(4), pp. 401-22. Swedish Institute of International Affairs.

**Royer, Jacques**—The Long-term Employment Impact of Disarmament Policies: Some Findings from an Econometric Model

This article examines the possible linkages between disarmament and development policies and their impact on employment. Assuming that significant cutbacks in defense expenditures would adversely affect employment, it argues that, in the long run, an effective way of enabling market forces to generate additional jobs in arms-producing sectors would be to use part of the released funds to finance specific development programs in the South. The employment impact of such massive transfers (both the direct effect in the South and the feedback to the North), however, is shown to be sensitive to the distribution policies governing the use of the funds both between receiving regions and, within regions, between low- and high-productivity activities. A world model is used to quantify several alternative sets of policies in eleven interdependent regions. *Int. Lab. Rev.*, May-June 1986, 125(3), pp. 279-303. University of Geneva.

## 120 COUNTRY STUDIES

### 121 Economic Studies of Developing Countries

**Shackleton, J. R.**—Privatising the Third World.

In recent years many third world countries have adopted policies of privatization and deregulation. The author examines the economic and political background to the development of state involvement in the third world and points to the problems that have led to a retreat from statist policies. He then discusses the prospects for privatization, arguing that the trend back toward the market offers some modest hope for economic improvement in the third world in the next decade. However, he is cau-

tious against treating privatization as a panacea. *Banca Naz. Lavoro Quart. Rev.*, Dec. 1986, (158), pp. 429-39. Polytechnic of Central London.

**Zehender, Wolfgang**—Industrialisierung und regionale Kooperation in Schwarzafrika (Industrialization and Regional Cooperation in Sub-Saharan Africa)

The failure of industrialization efforts in Africa is attributed primarily to inappropriate promotion policies, the absence of the socioeconomic and technological-scientific environment, and the smallness of national markets. Regional economic communities have not achieved the goal of developing a regional industrial base because of lack of industrial differentiation, adequate infrastructure, commensurate compensation mechanisms, and strong political will. It is argued that the potential for regional cooperation lies more in the SADCC pattern: implementation of common projects and programs and giving priority to national policies. The industrialization potential of the smaller African countries lies in the development of domestic markets and the improvement of the purchasing power in rural areas. *Konjunkturpolitik*, 1986, 32(4), pp. 218-35 (German). German Development Institute, Berlin.

### 122 Economic Studies of Developed Countries

**Giovannetti, Giorgia and Siniscalco, Domenico**—Structural Change, Foreign Trade and Income Multipliers in the Italian Economy

This paper presents a macroeconomic framework to reconsider some consequences of the growing international integration of the Italian productive system. The model, through a specific import function, combines two different approaches: the comparison of income multipliers over time, and the input-output analyses of the "sources of growth." Given an increase in the *i/o* coefficients linking intermediate and final imports to the different components of expenditure, the model allows to determine the growth in the export share, which offsets the decline in the multipliers and ensures the flow of proceeds to pay for the import required in the whole system. *Banca Naz. Lavoro Quart. Rev.*, Sept. 1986, (158), pp. 319-35. University of Rome, La Sapienza; University of Turin.

Gross, F. H.—How Bad Is Australia's Economic Performance and Why?

Practically the whole of Australia's slide down the income-per-head totem pole occurred before 1973. The paper advances the argument that "made to measure" protection and widespread restrictive trade practices used to be one of the main factors retarding faster growth in Australia before the 1970s, though deteriorating terms of trade also have been important. The profit squeeze resulting from real wage inflexibility during the 1970s has probably played an important role since then. *Econ. Rec.*, June 1986, 62(177), pp. 180-93. Australian National University.

Rothschild, Kurt W.—'Left' and 'Right' in 'Federal Europe'

The article analyzes the connection between political composition of governments and economic outcomes (growth, unemployment, inflation). Twelve European nations are investigated over the period 1960-84. Countries are grouped year after year in "left" and "right" subgroups and the group performances are compared. While there are no distinctive differences in the years of full employment the pictures change after 1970. The left group exhibits consistently higher growth and lower unemployment rates than the right group. As far as inflation is concerned, there is an indication that coalitions have generally fared better than either "pure" left or "pure" right governments. *Kyklos*, 1986, 39(3), pp. 359-76. University of Linz.

#### 124 Economic Studies of Centrally Planned Economies

Wong, Christine P. W.—The Economics of Shortage and Problems in Chinese Industry

This paper employs the economics of shortage framework to examine post-Mao reforms in Chinese state-owned industry. Performance has been disappointing because reforms through 1985 failed to fundamentally alter economic agent behavior. The "soft" budget constraints at the enterprise and local government levels continue to generate "quantity" and "expansion" drives. The resultant inflationary pressures have necessitated administrative interventions and thwarted reform progress. The

Maoist legacy of active participation by local governments in economic management is highlighted as a major obstacle to the elimination of paternalism in state-enterprise relations. *J. Compar. Econ.*, Dec. 1986, 10(4), pp. 363-87. Crown College, University of California, Santa Cruz.

#### 130 ECONOMIC FLUCTUATIONS; FORECASTING; STABILIZATION; AND INFLATION

##### 131 Economic Fluctuations

Farmer, Roger E. A.—Deficits and Cycles

This paper shows that periodic equilibria may arise in a simple overlapping generations model with capital. If the government follows a policy of fixing the value of the deficit, rather than fixing the value of government debt, then the difference equation that describes competitive equilibria may possess complex roots in the neighborhood of the golden rule stationary state. One may show that if there exist parametric families of economies for which these roots change stability then, locally, there exists an invariant closed curve. The paper provides two simple examples that generate such equilibria, and it solves these examples numerically. *J. Econ. Theory*, Oct. 1986, 40(1), pp. 77-88. University of Pennsylvania.

Fitoussi, J.-P. and Phelps, E. S.—Causes of the 1980s Slump in Europe

The paper criticizes existing explanations of the recent slump in Europe and sets forth the theory that a major role has been played through unnoticed channels by American shocks arising in the early 1980s: the shift to tight money, the Reagan tax cut, and the investment tax inducements. The authors argue that these shocks, operating principally through the real interest rate, had impacts upon price mark ups, upon the relative price of investment goods output, and upon investments in capital and hoarded labor in Europe; and these impacts led, in turn, to a contraction of European output and employment. *Brookings Pap. Econ. Act.*, 1986 (2), pp. 487-513. University of Paris; Columbia University.

Gebauer, Wolfgang—Kondratieff's Long Waves

The paper focuses on N. D. Kondratieff's long-wave hypothesis by providing further evidence, followed by an evaluation of recent theoretical work and some tentative policy conclusions. New data for selected European countries are analyzed with Kondratieff's original methods. The results are ambiguous; the existence of long waves remains an unresolved issue. The innovation hypothesis and distribution theorem are evaluated in view of their consistency with the alleged empirical characteristics of long waves. Both show weaknesses; the innovation approach is superior in terms of its cyclical properties. An extension of policy time horizons is suggested to cope with Kondratieff-like perspectives. *Konjunkturpolitik*, 1986, 32(4), pp. 235-55. European University, Florence.

**Goodwin, Richard M.**—The Economy as an Evolutionary Pulsator

The problem of long waves is formalized as one of the dynamical coupling of a relatively steady flow of new techniques and goods along with the endemic tendency of capitalism to evolve in a cyclical fashion. This implies a strong exogenous influence, which renders any precise periodicity unlikely. The model is illustrated by a hypothetical, historically determined potential that controls the path in time of the economy. *J. Econ. Behav. Organ.*, Dec. 1986, 7(4), pp. 341-49. University of Siena.

**Grandmont, Jean-Michel**—Stabilizing Competitive Business Cycles

The author studies how stylized monetary (proportional money transfers), fiscal (lump sum money transfers), and public expenditure policies may eliminate endogenous deterministic cycles and stationary Markov sunspot equilibria in a simple version of the overlapping generations model. Also new, constructive methods for analyzing stationary Markov sunspot equilibria in such a framework are presented. *J. Econ. Theory*, Oct. 1986, 40(1), pp. 57-76. CEPREMAP, Paris.

**Grandmont, Jean-Michel and Laroque, Guy**—Stability of Cycles and Expectations

The actual dynamics of an economy depends on how agents forecast the future at every date

as a function of their information on the past, while possibly learning the structure of their environment. The authors show in the case of a one dimensional state variable that under mild conditions on expectations functions, a given cycle with perfect foresight that is stable in the actual dynamics is stable in a fictitious backward perfect foresight dynamics. A restricted class of expectations functions for which the converse is true is exhibited. *J. Econ. Theory*, Oct. 1986, 40(1), pp. 138-51. CEPREMAP, Paris; INSEE, Paris.

**Hall, Robert E.**—Market Structure and Macroeconomic Fluctuations

Market structure and macroeconomic fluctuations are related to each other in two different ways. First, fluctuations reveal a good deal about market structure. When output rises, costs rise as well, and the ratio of the two reveals marginal cost. The comparison of price to marginal cost is a measure of market power. Second, market structure has an important role in the propagation of macroeconomic shocks. Competitive markets have a strong tendency toward full utilization of capacity, but that tendency is weak or absent with market power. The paper presents evidence about market power in about fifty industries and explores the implications for macroeconomics. *Brookings Pap. Econ. Act.*, 1986, (2), pp. 285-322. Stanford University and National Bureau of Economic Research.

**Hillinger, Claude**—Theorie und Empirie der Konjunkturzyklen (Business Cycles—Theory and Empirical Results)

A quantitative model incorporating insights of the traditional business cycle theory is presented. In an application to the Federal Republic of Germany, the existence of a 3.8 year inventory cycle and an 8.2 year equipment cycle are demonstrated. Together these cycles explain 72 percent of the cyclical fluctuations of the GDP. Comparable results for ten OECD countries are summarized. These results suggest the need for a revision of contemporary macroeconomics. A theory of business cycles that is compatible with the evidence is sketched in the paper. *Konjunkturpolitik*, 1986, 32(3), pp. 101-29 (German). University of Munich.

**McGavin, Brian H.**—The Political Business Cycle: A Reexamination of Some Empirical Evidence

The political business cycle usually is accepted as a stylized fact of democratic industrial countries. Several papers, however, have brought the existence of the political business cycle into question. Perhaps the most prominent and widely cited is B. McCallum. McCallum theorizes that the political business cycle is inconsistent with rational expectations *cum* natural rate hypothesis. His evidence supports his conjecture. This paper investigates the effects of changing several features of McCallum's methodology. The results indicate that inferences from these tests regarding the political business cycle are sensitive to the underlying assumptions. Inferences based on McCallum's work are tenuous. *Quart. J. Bus. Econ.*, Winter 1987, 26(1), pp. 36-49. Florida State University.

**Michlin, Pietro**—Equilibrium Cycles in an Overlapping Generations Economy with Production

Perfect foresight equilibrium trajectories of an overlapping generations model with production may include stable or unstable invariant closed curves. These orbits are detected using the Hopf bifurcation theorem, where the parameter of bifurcation is purely technological. The paper also proves that there is a stabilization policy that completely eliminates the cycle. Finally, using a C.E.S. production function, it is shown that the range of values of the elasticity of substitution between capital and labor for which cycles may exist is bounded above. *J. Econ. Theory*, Oct. 1986, 40(1), pp. 89-102. Columbia University.

**Neiffer, Andrei**—Implementation Cycles

The paper describes an artificial economy in which firms in different sectors make inventions at different times, but innovate simultaneously take advantage of high aggregate demand. Then, high demand results from simultaneous innovation in many sectors. The economy exhibits multiple cyclical equilibria, with entrepreneurs' expectations determining which equilibrium obtains. These equilibria are Pareto ranked, and the most profitable equilibrium

need not be the most efficient. While an informed stabilization policy can sometimes raise welfare, if large booms are necessary to cover fixed costs of innovation, stabilization policy can stop all technological progress. *J. Polit. Econ.*, Dec. 1986, 94(6), pp. 1163-90. Princeton University.

**Woodford, Michael**—Stationary Sunspot Equilibria in a Finance Constrained Economy

Stationary sunspot equilibria are shown to exist in a production economy with infinite lived agents, when it is not possible to borrow against future wage income. Equilibrium fluctuations exhibit persistence over time scales of the same order of magnitude as observed "business cycles." An active fiscal policy that stabilizes aggregate money expenditures can prevent such fluctuations. *J. Econ. Theory*, Oct. 1986, 40(1), pp. 128-37. Columbia University and Carnegie-Mellon University.

### 132 Forecasting; Econometric Models

**Virén, Matti**—Estimating the Output Effects of Energy Price and Real Interest Rate Shocks: A Cross-Country Study

This paper is concerned with investigating how inflation, interest rate, and energy price shocks affect the real side of the economy. Estimating a simple aggregate demand model from the data of ten Western countries shows that the behavior of aggregate output is very much affected by these shocks. In particular, it turns out that real interest rate shocks represent a major source of variability in terms of the growth rate of total output. *Schweiz. Z. Volkswirtschaft. Statist.*, Dec. 1986, 122(4), pp. 627-39. Bank of Finland, Helsinki.

### 133 General Outlook and Stabilization Theories and Policies

**Borio, C. E. V.**—Do Contingent Rules Really Dominate Fixed Rules?

In this paper the author examines the generality of the proposition (Willem Buiter [1981]) that innovation-contingent (or feedback or closed-loop) policies are always superior to non-innovation-contingent (or fixed or open-loop) policies in the design of stabilization programmes unless: (1) they arbitrarily increase the randomness of current and future policy

instruments or (2) the authorities either pursue the wrong objectives or else pursue the right objectives in an inept manner. What is at stake here is the general presumption that acting on more information is necessarily beneficial to the economic agent. *Econ. J.*, Dec. 1986, 96(384), pp. 1000-1010. Brasenose College, Oxford University.

**Calmfors, Lars and Horn, Henrik—Employment Policies and Centralized Wage-Setting**

The combination of stagflation and rapid expansion of the public sector has been characteristic for the smaller European economies with centralized wage setting. One interpretation is that active employment policies have contributed to excessive real wage increases. The paper sets up a model of centralized wage setting that is used to examine this hypothesis under different assumptions about: (1) government employment goals; (2) trade union perceptions; and (3) the ways that government expenditures are financed. It is shown that employment policies may actually reduce employment at the same time as they cause a structural transformation of the economy. *Economica*, Aug. 1986, 53(211), pp. 281-302. University of Stockholm.

**Masera, Rainer S.—Europe's Economic Problems in an International Perspective**

European problems must be assessed in a world context. Medium-term external-payments compatibility requires reciprocal adjustment of policy mixes. A reduction in the U.S. budget deficit is necessary; devaluation alone will not produce the required changes in relative prices or a permanent shift between production and absorption. But the adjustment must not involve recessionary consequences globally. The European countries that have achieved structural budget equilibrium and very low inflation should discontinue their restrictive fiscal and monetary mixes. Microeconomic labor market adjustment is the appropriate complement throughout Europe to improve internal and external balance and reabsorb unemployment. *Banca Naz. Lavoro Quart. Rev.*, Dec. 1986, (159), pp. 391-406. Bank of Italy, Rome.

**Neale, Walter C.—Tax-Based Incomes Policies: A Commentary for the Future**

TIP will be needed when full employment returns. Discusses earlier literature: TIP's attack on inflation at micro and macro levels simultaneously; probable effectiveness of variants of TIP; confusions about role of productivity in justifying wage increases. Then analyzes newly arising problems: whether to penalize wage rates or total wages and salaries; consequent changes in nature and aims of unions, which will need to bargain about overtime, differentials, and "right to the job" rather than wages; and questions about defining profits and how to treat companies that earn no profits. Concludes with argument for levying stiff penalties on net value added. *J. Econ. Issues*, Dec. 1986, 20(4), pp. 969-87. University of Tennessee.

**Neck, Reinhard—Kann Stabilisierungspolitik unter Unsicherheit und Risiko "optimal" sein? (Can Stabilization Policy Be "Optimal" under Uncertainty?)**

This paper investigates the possibilities of "optimal" stabilization policies under uncertainty and risk. Starting from a decision-theoretic framework of the theory of economic policy, the author distinguishes between "stochastic uncertainty," "strategic uncertainty," and "fundamental uncertainty." Using results of optimal control and dynamic game theory, it is shown that "optimal" stabilization policies exist in general under stochastic uncertainty; under strategic uncertainty, however, "optimality" can only be defined for particular solution concepts and particular information patterns. In many cases "feedback policies" are "optimal" for both situations; "contingent rules" and systematic discretionary policies generally outperform "fixed rules." *Schweiz. Z. Volkswirtschaft. Statist.*, Sept. 1986, 122(3), pp. 509-34 (German). Wirtschaftsuniversität Wien.

**Richards, Peter J.—Preserving Jobs under Economic Stabilization Programmes: Can There Be an Employment Target?**

This article discusses stabilization measures in developing countries faced with a severe, nontemporary balance-of-payments crisis. Such measures are usually associated with economic contraction and job loss. A number of proposals are reviewed by which stabilization could be

made less socially disruptive, with special reference to the feasibility of setting an employment target. Stabilization programs usually fix indicative targets for output growth and it may be possible to include a minimum target for, say, child nutrition. It is, however, unclear how such a provision would work in practice. Employment targets would have similarities with social targets but, unlike the latter, they could not be achieved simply by changing government expenditure patterns. *Int. Lab. Rev.*, July-Aug. 1986, 125(4), pp. 423-34. International Labour Office.

### 134 Inflation and Deflation

**Batton, Dallas S. and Hafer, R. W.**—The Impact of International Factors on U.S. Inflation: An Empirical Test of the Currency Substitution Hypothesis

This paper rejects the currency substitution with regard to the determination of U.S. inflation. Quarterly estimates for 1972-82 demonstrated that changes in the effective exchange rate—argued by some to be the proper measure of foreign influences on domestic inflation—have no significant explanatory power in explaining inflation when combined with M1 growth. This result holds using the broad GNP deflator and wholesale prices. It also is shown that while a rest-of-world money growth variable does significantly add to M1 in explaining wholesale price inflation, it is not significant using the GNP deflator series. *Southern Econ. J.*, Oct. 1986, 53(2), pp. 400-412. Federal Reserve Bank of St. Louis; Washington University, St. Louis.

**Chappell, David**—The Optimal Rate of Inflation When the Rate of Growth of the Money Supply Is Stochastic

A model of the Bailey/Tower type in which the rate of growth of the money supply is stochastic is analyzed. It is shown that the optimal (i.e., revenue maximizing) rate of inflation is higher than in the corresponding deterministic case by an amount that depends positively on the variance of the money supply growth rate. The reason for this is the asymmetry of the Government Revenue functions. The model thus provides a possible explanation for the "excessive" rates of inflation observed in several econ-

omies. *Manchester Sch. Econ. Soc. Stud.*, Sept. 1986, 54(3), pp. 314-21. University of Sheffield.

**Early, John F.; Lane, Walter and Sturm, Philip**—A Half-Year Pause in Inflation: Its Antecedents and Structure

This article analyzes inflation, as measured by the Consumer Price Index for all Urban Consumers, during the first six months of 1986. It gives historical data from December 1960 and detailed sector-by-sector assessments of the status of consumer price change in mid-1986. The authors state that the decline in the overall CPI of 0.2 percent during the first six months of 1986 was attributable to the sharp decline in energy prices—fuel oil, coal, bottled gas, and motor fuels fell at an annual rate of 40.2 percent. Although shelter costs continued to advance at an annual rate of about 5 percent, price moderation was very widespread. *Mon. Lab. Rev.*, Oct. 1986, 109(10), pp. 3-14. Bureau of Labor Statistics.

### 200 Quantitative Economic Methods and Data

#### 210 ECONOMETRIC, STATISTICAL, AND MATHEMATICAL METHODS AND MODELS

##### 211 Econometric and Statistical Methods and Models

**Andrews, Donald W. K.**—Stability Comparisons of Estimators

This paper investigates a property of estimators called stability. The stability exponent of an estimator is defined to be a measure of the effect of any single observation in the sample on the realized value of the estimator. High stability often is desirable for robustness against misspecification and against highly variable observations. Stability exponents are determined and compared for a wide variety of estimators and econometric models. They are found to depend on the maximal moment exponent (i.e., the number of finite moments) of the estimator's influence curve. *Econometrica*, Sept. 1986, 54(5), pp. 1207-35. Cowles Foundation, Yale University.

**Breusch, Trevor S.**—Hypothesis Testing in Unidentified Models

An identified model is not necessary for statistical inference, but ambiguities can arise. This paper examines some simple examples and proposes a framework that distinguishes between the "refutation" and "confirmation" aspects of testing in an unidentified model. One particular problem is the interpretation given to overidentifying restrictions: a common view is that these are somehow not properly testable. *Rev. Econ. Stud.*, Aug. 1986, 53(4), pp. 635-51. Australian National University.

**Breck, William A.**—Distinguishing Random and Deterministic Systems: Abridged Version

This paper attempts to give a mathematically precise version of recent tests on an observed time series  $\{a_t\}$  for the presence of low dimensional deterministic chaos. Three practical tests for chaos are discussed: (1) the correlation dimension of  $\{a_t\}$  must be low; (2) the estimated largest Lyapunov exponent must be positive; (3) the residuals  $\{a_t\}$  of an estimated linear time (or nonlinear) series model (for a large class of such models) must have the same dimension and largest Lyapunov exponent as  $\{a_t\}$ . Based on (1)-(3) evidence for chaos in post-World War II, U.S. quarterly real GNP is weak. *J. Econ. Theory*, Oct. 1986, 40(1), pp. 168-95. University of Wisconsin.

**Burtless, Gary and Orr, Larry L.**—Are Classical Experiments Needed for Manpower Policy?

The critical element that distinguishes classical experiments from all other modes of analysis is the random assignment of treatment to enrollees in a study. This paper examines the major methodological advantages of random assignment for the purpose of estimating the effectiveness of current manpower policy. It also reviews the claimed methodological and ethical objections to experiments. The main valid objection to an experiment is neither methodological nor ethical, it is the experiment's cost compared with that of nonexperimental methods of analysis. The authors argue that the offsetting gain from experimentation is the inherent reliability of experimental estimates of treatment effects. *J. Human Res.*, Fall 1986, 21(4), pp. 606-32. Brookings Institution; Abt Associates.

**Campos, Julia**—Finite-Sample Properties of the Instrumental-Variables Estimator for Dynamic Simultaneous-Equation Subsystems with ARMA Disturbances

Numerical-analytical approximations to the finite sample moments of the instrumental variables estimator (IVARMA) of possibly incomplete dynamic simultaneous equation systems with ARMA disturbances are obtained. Monte Carlo methods are proposed and implemented for studying the finite sample bias, standard error, and estimated asymptotic standard error. A control variate is derived for constructing efficient Monte Carlo estimators and response surfaces are developed. *J. Econometrics*, Aug. 1986, 32(3), pp. 333-66. Central Bank of Venezuela, Caracas.

**Collender, Robert Neil and Chalfant, James A.**—An Alternative Approach to Decisions under Uncertainty Using the Empirical Moment-Generating Function

Objections to mean-variance analysis center on the requirement that the distributions be normal or the resulting inattention to higher-order moments when the solution is viewed as an approximation. A nonparametric approach to decision making under uncertainty is developed in this paper using expected utility maximization, the exponential utility function, and an empirical moment-generating function. A decision rule is obtained for land allocation under uncertainty, which is not tied to a particular family of distributions and accounts for all moments of the distribution. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 727-31. North Carolina State University; University of California, Berkeley.

**Ericsson, Neil R.**—Post-simulation Analysis of Monte Carlo Experiments: Interpreting Pesaran's (1974) Study of Non-nested Hypothesis Test Statistics

Monte Carlo studies may be divided operationally into three phases: design, simulation, and post-simulation analysis. This paper provides a guide to the last of these, and uses M. H. Pesaran's (1974) study of statistics for testing nonnested hypotheses to illustrate the techniques described. A statistic is derived for testing for significant deviations between the

asymptotic and (observed) finite sample properties. Further, that statistic provides the basis for analyzing discrepancies between the finite sample and asymptotic properties using response surfaces. Finally, a method is proposed for adjusting the finite sample sizes of different test statistics so that comparisons of their power can be made. *Rev. Econ. Stud.*, Aug. 1986, 53(4), pp. 691-707. Federal Reserve Board.

**Geweke, John; Marshall, Robert C. and Zarkin, Gary A.**—Exact Inference for Continuous Time Markov Chain Models

Methods for exact Bayesian inference under a uniform diffuse prior are set forth for the continuous time homogeneous Markov chain model. It is shown how the exact posterior distribution of any function of interest may be computed using Monte Carlo integration. The solution handles the problems of embeddability in a very natural way, and provides (to our knowledge) the only solution that systematically takes this problem into account. The methods are illustrated using several sets of data. *Rev. Econ. Stud.*, Aug. 1986, 53(4), pp. 653-69. Duke University.

**Hamilton, James D.**—A Standard Error for the Estimated State Vector of a State-Space Model

The Kalman filter is an increasingly used tool in economics for models that can be expressed in state-space form. For empirical applications in which model parameters must be estimated from the data, the econometrician may wish to describe how far estimates of the state vector might be from true values. This paper motivates a standard error for the estimated state vector that takes into account both parameter and filter uncertainty. *J. Econometrics*, Dec. 1986, 33(3), pp. 387-97. University of Virginia.

**King, Maxwell L. and Smith, Murray D.**—Joint One-Sided Tests of Linear Regression Coefficients

This paper considers the problem of testing whether a subset of regression coefficients are jointly zero, assuming knowledge of the coefficients' signs. If this knowledge is ignored, the likelihood ratio, Wald, and Lagrange multiplier

tests are each equivalent to the  $F$ -test. The authors propose a new test, which has an optimal power property and can be applied as a  $t$ -test. Empirical power comparisons with the power envelope, the  $F$ -test, and the exact one-sided likelihood ratio test show that the new test can have exceptionally good power over a wide range of the parameter space. *J. Econometrics*, Aug. 1986, 32(3), pp. 367-83. Monash University, Clayton, Australia; University of New South Wales, Kensington, Australia.

**Molinas, César**—A Note on Spurious Regressions with Integrated Moving Average Errors

The expected value of sample autocorrelations for Integrated Moving Average (IMA) processes can be well below unity. In that case, when testing for cointegration, it is shown that several test statistics related to these autocorrelations have a very poor performance. *Oxford Bull. Econ. Statist.*, Aug. 1986, 48(3), pp. 279-82. Ministry of Economy and Finance, Spain and University of Barcelona.

**Moulton, Brent R.**—Random Group Effects and the Precision of Regression Estimates

When explanatory variable data in a regression model are drawn from a population with grouped structure, the regression errors are often correlated within groups. Error-component and random-coefficient regression models are considered as models of the intraclass correlation. This paper analyzes several empirical examples to investigate the applicability of random effects models and the consequences of inappropriately using ordinary least squares (OLS) estimation in the presence of random group effects. The principal findings are that the assumption of independent errors is usually incorrect and the unadjusted OLS standard errors often have a substantial downward bias, suggesting a considerable danger of spurious regression. *J. Econometrics*, Aug. 1986, 32(3), pp. 385-97. U.S. Bureau of Labor Statistics.

**Pagan, Adrian**—Two Stage and Related Estimators and Their Applications

This paper aims to provide a unified treatment of the properties of two stage estimators. General conditions are set forth for consistency, efficiency, and correct inferences. Applications

of the general theorems are made to models with expectations and diagnostic tests. The general approach frequently enables much simpler derivation of existing results, and provides a number of new ones. *Rev. Econ. Stud.*, Aug. 1986, 53(4), pp. 517-38. Australian National University.

**Phillips, P. C. B. and Durlauf, S. N.**—Multiple Time Series Regression with Integrated Processes

This paper develops a general asymptotic theory for processes that are integrated of order one. The theory includes vector auto regressions and multivariate regressions among integrated processes that are driven by innovation sequences that allow for a wide class of weak dependence and heterogeneity. The models studied cover cointegrated systems such as those studied by C. W. J. Granger and R. F. Engle and general linear simultaneous equations systems with contemporaneous regressor error correlation and serially correlated errors. Problems of statistical testing are also studied. *Rev. Econ. Stud.*, Aug. 1986, 53(4), pp. 473-95. Yale University.

**Powell, James L.**—Symmetrically Trimmed Least Squares Estimation for Tobit Models

This paper proposes alternatives to maximum likelihood estimation of the censored and truncated regression models. The proposed estimators are based upon symmetric censoring or truncation of the upper tail of the distribution of the dependent variable. The estimators are semiparametric, in the sense that they are consistent and asymptotically normal for a wide class of (symmetric) error distributions with heteroskedasticity of unknown form. The paper gives the regularity conditions and proofs of these large sample properties, demonstrates how to construct consistent estimators of the asymptotic covariance matrices, and presents the results of a simulation study for the censored case. *Econometrica*, Nov. 1986, 54(6), pp. 1435-60. University of Wisconsin.

**Stoker, Thomas M.**—Consistent Estimation of Scaled Coefficients

This paper studies the estimation of coefficients in index models, where the basic stochas-

tic structure is unknown. Index models arise in many practical situations requiring modeling of limited dependent variables. A general connection between behavioral derivatives and covariance estimators is established, which indicates how coefficients can be estimated up to scale using information on the distribution of the explanatory variables in the model. A sample covariance estimator and an instrumental variables estimator are proposed. Also discussed are asymptotic distribution theory and the bias in ordinary least squares regression coefficients. *Econometrica*, Nov. 1986, 54(6), pp. 1461-81. Massachusetts Institute of Technology.

**Watson, Mark W.**—Univariate Detrending Methods With Stochastic Trends

This paper discusses detrending economic time series when the trend is modeled as a stochastic process. It considers unobserved components models in which the observed series is decomposed into a trend (a random walk with drift) and a residual stationary component. Optimal detrending methods are discussed, as well as problems associated with using these detrended data in regression models. The methods are applied to three time series: GNP, disposable income, and consumption expenditures. The detrended data are used to test a version of the life-cycle consumption model. *J. Monet. Econ.*, July 1986, 18(1), pp. 49-75. Harvard University and National Bureau of Economic Research.

**West, Kenneth D.**—Full- versus Limited-Information Estimation of a Rational-Expectations Model: Some Numerical Comparisons

This paper compares numerically the asymptotic distributions of parameter estimates and test statistics associated with two estimation techniques: (1) a limited information one, which uses instrumental variables to estimate a single equation and (2) a full information one, which uses a procedure asymptotically equivalent to maximum likelihood to simultaneously estimate multiple equations. It is found that: (1) full information standard errors are only moderately smaller than limited information standard errors and (2) when the model is misspecified, full information tests tend to be more powerful,

and its parameter estimates tend to be more biased. *J. Econometrics*, Dec. 1986, 33(3), pp. 367-85. Princeton University.

### 812 Construction, analysis, and use of econometric models

**Bartik, Timothy J.**—The Estimation of Demand Parameters in Hedonic Price Models

This paper shows that the econometric problem of estimating hedonic demand parameters is not a standard identification problem caused by demand-supply interaction, as has been often assumed. Estimation procedures based on this assumption lead to biased results. The hedonic estimation problem is instead caused by the endogeneity of both prices and quantities when households face a nonlinear budget constraint. An instrumental variables solution to this problem is suggested using instruments that exogenously shift the budget constraint. *J. Polit. Econ.*, Feb. 1987, 95(1), pp. 81-88. Vanderbilt University.

**Bean, Charles R.**—The Estimation of "Surprise" Models and the "Surprise" Consumption Function

The first part of the paper outlines a simple method for estimating a class of models in which "surprises" appear and expectations are formed rationally. The second part of the paper applies the method to R. E. Hall's random walk model of consumption, which is extended to allow for stochastic interest rates and for leisure and government spending to be substitutes for private spending. Approximate restrictions due to the rational expectations hypothesis are derived but they are marginally rejected by the data. The ability of the life cycle with rational expectations model to encompass alternative models is also evaluated. *Rev. Econ. Stud.*, Aug. 1986, 53(4), pp. 497-516. London School of Economics.

**Buccola, Steven T. and McCarl, Bruce A.**—Small-Sample Evaluation of Mean-Variance Production Function Estimators

Production functions have been shown to be useful for characterizing input effects on both the mean and variability of yield. Monte Carlo experiments are used here to investigate small-sample properties of selected mean-variance

production function estimators. Estimation efficiency in the mean is found to improve with iteration on the mean and variance components. Although efficiency in the variance is greatest at the first stage, bias in the variance diminishes through at least the second stage. These effects are influenced by the degree and sign of heteroscedasticity and by sample size. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 732-38. Oregon State University; Texas A&M University.

**Chetty, V. K. and Heckman, J. J.**—A Dynamic Model of Aggregate Output Supply, Factor Demand and Entry and Exit for a Competitive Industry with Heterogeneous Plants

This paper presents a dynamic model of entry and exit of firms and plants of firms in a competitive industry with heterogeneous productive units. The model generalizes H. S. Houthakker's Cobb-Douglas model to a dynamic setting with firm investment. The model does not justify conventional representative firm approaches to modeling aggregate production technology. Unlike conventional rigid lag models, the derived lag structure in this model depends on the economic history of the industry. Nonetheless, the model is empirically tractable. Estimates of the model on U.S. data indicate that the framework can account for empirically important aspects of industry dynamics of factor demand and output supply. *J. Econometrics*, Oct./Nov. 1986, 33(1/2), pp. 237-62. Indian Statistical Institute, New Delhi; University of Chicago.

**Chong, Yock Y. and Hendry, David F.**—Econometric Evaluation of Linear Macro-Economic Models

In so far as they claim to represent economic behavior, empirical macroeconomic systems are open to direct evaluation and testing against data information. Since system characteristics are the prime concern of economy-wide models, it might be the case that the validity of every individual component is not essential to adequate overall performance. A new "limited information" test of forecast encompassing is proposed, based only on forecasts and requiring no other data from a model's proprietors. The derivation, merits, and drawbacks of such a test

are presented together with some suggestions for testing entailed relationships and interequation feedbacks. *Rev. Econ. Stud.*, Aug. 1986, 53(4), pp. 671-90. Nuffield College, Oxford University.

**Despotakis, Kostas A.**—Economic Performance of Flexible Functional Forms: Implications for Equilibrium Modeling

Flexible functional forms are well behaved over restricted regions—the outer domain—and constitute “good” approximations of a hypothetical true technology (set of preferences) over only a subregion of the outer domain—the inner domain. Comparison of such forms has been made in terms of outer domain. Ideally, it should also cover the inner domain. By definition, however, the inner domain is unquantifiable. Instead, functions representing producer technology (consumer preferences) can be characterized and compared in terms of what is called in this paper economic performance. Focusing on the producer side, the author demonstrates that relative differences and associated implications for equilibrium modeling can be substantial. *Europ. Econ. Rev.*, Dec. 1986, 30(6), pp. 1107-43. University of California, Berkeley.

**Garrod, Peter V. and Roberts, Roland K.**—Prices as Proxies for Prices

It is unusual for the precise price data required by economic theory to be available, and as a result, many applied studies use information on regional or average prices as proxies for the specific prices required. The use of one price as a proxy for another, however, introduces all the problems associated with the use of proxy variables into the analysis; and these problems may persist, particularly those associated with specification errors, even if the proxy is highly correlated with the true variable. It is possible, however, to minimize the impact of specification errors by adding additional variables. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 626-33. University of Hawaii; University of Tennessee.

**Granger, Clive W. J.**—Developments in the Study of Cointegrated Economic Variables

A pair of series are called cointegrated if they have identical long-run components. It follows that they may be thought of as being generated by an error correction, partly driven by the extent to which the series are out of equilibrium. A number of interesting consequences arise with clear economic interpretations. The paper discusses a number of generalizations of the concept, to many dimensions, time-varying parameters and nonlinear models. *Oxford Bull. Econ. Statist.*, Aug. 1986, 48(3), pp. 213-28. University of California, San Diego.

**Hall, S. G.**—An Application of the Granger & Engle Two-Step Estimation Procedure to United Kingdom Aggregate Wage Data

In this paper the Granger and Engle two-step procedure is used in the estimation of an aggregate wage equation for the United Kingdom, which incorporates a term in the expected rate of price inflation. Typically, when such a term is included and standard econometric techniques are used on U.K. data, the value of the parameter on expected prices is quite a lot larger than unity. The use of the two-stage estimation technique will be seen to produce a set of parameter estimates that is much closer to the *a priori* expectation. *Oxford Bull. Econ. Statist.*, Aug. 1986, 48(3), pp. 229-39. National Institute of Economic and Social Research, London.

**Hazilla, Michael and Kopp, Raymond J.**—Testing for Separable Functional Structure Using Temporary Equilibrium Models

The importance that functional structure plays in the analysis of producer behavior is well known and responsible for the empirical tests of input separability hypotheses found in the contemporary literature. Unfortunately, to our knowledge all such tests have been conducted under the maintained assumption of full factor input equilibrium. In this paper the authors propose and implement a method for testing functional structure hypotheses when the behavioral units are permitted to be in disequilibrium. The results of this more general test provide less support for the existence of input separability in two-digit manufacturing than previously reported by the authors using tests assuming full equilibrium. *J. Econometrics*,

Oct./Nov. 1986, 33(1/2), pp. 119-41. Resources for the Future, Washington, D.C.

**Headry, David F.**—Econometric Modelling with Cointegrated Variables: An Overview

This overview introduces a special issue on cointegration and the existence of long-run economic relationships. The concepts of integration and cointegration are discussed against the historical background of research on spurious regressions. Modeling issues concern the fitting of static regressions to cointegrated data series; the associated testing theory; testing for unit roots; and fitting error correction models. The problems of autocorrelation corrections and multicollinearity are reviewed, as is the dimensionality issue for relating stocks and flows. A brief description is provided of the other papers in the special issue. *Oxford Bull. Econ. Statist.*, Aug. 1986, 48(3), pp. 201-12. Nuffield College, Oxford University.

**LaFrance, Jeffrey T.**—The Structure of Constant Elasticity Demand Models

Applied agricultural economics extensively uses the demand model with constant price and income elasticities. This paper analyzes the structure of incomplete systems of constant elasticity demand functions, demonstrating a duality theory analogous to that for complete systems. This theory permits recovery of that portion of direct and indirect preferences pertaining to goods of interest. One can calculate exact welfare measures for income and price changes of these goods. For an incomplete system of constant elasticity demands, Slutsky symmetry restrictions for integrability are presented and the implied structure of direct and indirect preferences of prices and goods of interest is derived. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 543-52. Montana State University.

**Lee, Lung-Fei**—The Specification of Multi-market Disequilibrium Econometric Models

The specifications of multi-market disequilibrium econometric models are clouded with different notions of effective demand. This paper points out that the specification of such models for econometric analysis can be achieved from the basic concept of fixed price equilibrium and without the use of the concepts

of effective demand. The specifications of T. Ito and C. J. J. Gourieroux, J. J. Laffont, and A. Monfort are justified within this framework. With proper stochastic elements introduced in the system, the derived likelihood function from this approach does not involve multiple integrals and is computationally tractable for models with many markets. *J. Econometrics*, Aug. 1986, 32(3), pp. 297-332. University of Minnesota.

**Lee, Lung-Fei and Pitt, Mark M.**—Micro-econometric Demand Systems with Binding Nonnegativity Constraints: The Dual Approach

This paper considers the problem of specifying and estimating demand systems for samples that contain a significant proportion of observations with zero purchase or consumption of one or more goods. This approach uses virtual prices, which are dual to the Kuhn-Tucker conditions, to select the set of goods consumed—the demand regime—and to transform binding nonnegativity constraints into nonbinding constraints. It has the advantage of permitting the use of indirect cost and utility functions such as the translog and the analytic decomposition of demand effects for goods at the nonnegativity limit. *Econometrica*, Sept. 1986, 54(5), pp. 1237-42. University of Minnesota.

**Mullahy, John**—Specification and Testing of Some Modified Count Data Models

This paper explores the specification and testing of some modified count data models. These alternatives permit more flexible specification of the data-generating process than do familiar count data models, and provide natural means for modeling data that are over- or under-dispersed. In the cases considered, the familiar forms of the distributions result as parameter-restricted versions of the modified distributions. Accordingly, score tests of the restrictions that use only the ML estimates of the standard models are proposed. The specification tests of J. A. Hausman and H. White are also considered. An example using survey microdata on beverage consumption is presented. *J. Econometrics*, Dec. 1986, 33(3), pp. 341-65. Yale University and Resources for the Future, Washington, D.C.

**Naik, Gopal and Leuthold, Raymond M.—A Note on Qualitative Forecast Evaluation**

Traditionally, the 2 x 2 contingency table method has been used for qualitative evaluation of forecasts. However, the conclusions drawn based on this method could be misleading because it does not account for the direction of the turning or no turning points. A 4 x 4 contingency table, which overcomes this weakness and which gives more information on the qualitative performance of the forecast, is suggested. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 721-26. University of Illinois.

**Prucha, Ingmar R. and Nadiri, M. Ishaq—A Comparison of Alternative Methods for the Estimation of Dynamic Factor Demand Models under Non-static Expectations**

Several approaches to the formulation and estimation of dynamic factor demand systems under nonstatic expectations on the exogenous variables in the firm's decision process have been suggested. Among those approaches there are trade-offs in terms of statistical and computational efficiency, the generality with which the technology and the expectation-formation process can be specified, and informational requirements. This paper analyzes the trade-offs among three alternative approaches in terms of their statistical and computational efficiency within the context of a Monte Carlo experiment. *J. Econometrics*, Oct./Nov. 1986, 33(1/2), pp. 187-211. University of Maryland; New York University.

**Weissenberger, Edgar; Müller-Brockhausen, Gerd and Welsch, Heinz—A Factor Demand Model with Quasi-fixed Factors and Rational Expectations**

A dynamic model of factor demand is presented within which the rationality of output and price expectations is tested. The model is estimated using yearly U.S. manufacturing data. Testing the overidentifying restrictions for Model A, these restrictions have to be rejected at the 0.01 significance level. After dropping the variable factor demand function the REH restrictions are rejected at the 0.05 level. Subsequently, the temporal response of capital and labor to output and price innovations is traced. In three out of four cases these responses reach

their maximum effects only after three to five years. *J. Econ. (Z. Nationalökon)*, 1986, 46(2), pp. 123-42. Cisi-Wharton Econometric Forecasting Associates, Frankfurt; University of Bonn; University of Bonn.

**Whiteman, Charles H.—Analytical Policy Design under Rational Expectations**

The formulation of optimal policy in linear rational expectations models is studied using methods analogous to the classical design techniques utilized in linear systems engineering. The use of frequency-domain, Wiener-Hopf methods makes it a simple matter to account for the effects of alternative "regimes" on expectations. The solution to the problem is a closed form expression for the decision rule of the dominant player in a particular type of linear-quadratic dynamic game. *Econometrica*, Nov. 1986, 54(6), pp. 1387-1405. The University of Iowa.

**213 Mathematical Methods and Models**

**Evans, George W.—Selection Criteria for Models with Non-uniqueness**

Three objections are considered to the use of B. T. McCallum's rules for picking the minimal state set solution in rational expectations models with multiple equilibria. It is shown that these difficulties can be resolved using the concept of expectational stability as a selection criterion. *J. Monet. Econ.*, Sept. 1986, 18(2), pp. 147-57. Stanford University.

**Fishburn, Peter C.—Implicit Mean Value and Certainty Equivalence**

Past notions of mean value include expected values, the quasilinear mean, and Chew's weighted quasilinear mean. This paper axiomatizes a generalized mean value defined implicitly for each probability measure on the real numbers. The relationship between this mean and certainly equivalence for nontransitive and nonlinear utility theory is discussed. *Econometrica*, Sept. 1986, 54(5), pp. 1197-1205. AT&T Bell Laboratories, Murray Hill, New Jersey.

**215 Experimental Economic Methods**

**Bull, Clive; Schotter, Andrew and Weigelt, Keith—Tournaments and Piece Rates: An Experimental Study**

This paper presents an experimental examination of rank-order tournaments and piece rates. Ten experiments were run employing identical volunteers. While, in general, the mean effort levels chosen by subjects converged toward their theoretical equilibrium levels in both piece rate and symmetric tournament experiments, a large variance was observed for rank-order tournaments, and this variance persisted despite a number of different tournaments. The variance in the piece rate experiment was quite small. In the one asymmetric tournament, it was observed that while the mean effort level of "advantaged" subjects converged toward its theoretic equilibrium level, the mean effort level of disadvantaged subjects remained above their equilibrium level. *J. Political Econ.*, Feb. 1987, 95(1), pp. 1-33. New York University.

#### ECONOMIC AND SOCIAL STATISTICAL DATA AND ANALYSIS

##### National Income Accounting

Leuw, Frank—An Indirect Technique for Measuring the Underground Economy: A Note on Revised Data

A recently introduced technique for measuring the underground economy is based on comparing, for selected indicators, industries in which much underground activity is thought to take place (such as construction) with other industries. Application of the technique to U.S. national income before the comprehensive 1985 revision suggested some understatement of growth from 1949 to 1982. The present study examines U.S. data after the 1985 revision, which featured sizable new adjustments for underreporting of proprietors' income. The reexamination suggests that the revision substantially reduced understatement of growth, to a rate significantly different from zero. *Survey of Bus.*, Sept. 1986, 66(9), pp. 21-22. Bureau of Economic Analysis, U.S. Department of Commerce.

##### Input-Output

Ueda, Yukio—A More Powerful Method for Triangularizing Input-Output Matrices and the Similarity of Production Structures  
This paper extends and refines the previous

triangularization method, which is based on a permutation theorem deriving from the interchange of adjoining two industrial groups, into that among three industrial groups (Theorem 2). The new algorithm based on Theorem 2 is demonstrated by actually computing the suboptimal orderings for the four input-output tables for such more-developed countries as the United States, Italy, Norway, and Japan, and the two tables for such less-developed countries as India and Korea. The empirical results support the similarity of hierarchical structures of production among these countries. *Econometrica*, Nov. 1986, 54(6), pp. 1425-33. Osaka Industrial University, Japan.

##### 224 National Wealth and Balance Sheets

Lindert, Peter H.—Unequal English Wealth since 1670

New data on probated wealth, landownership, debts, and occupations extend the view of the distribution of English wealth back from 1911 to 1670. There were widening gaps in mean wealth between the top landed-plus-merchant classes and the middle classes across the Industrial Revolution century. Size distributions for individual assets also widened. So did those for income or total wealth (including human). But nonhuman net worth did not become more unequal because of important shifts in the land share. All inequality measures before 1914 exceeded all those since 1950. The estimates illuminate classical theories of distribution. *J. Polit. Econ.*, Dec. 1986, 94(6), pp. 1127-62. University of California, Davis.

##### 226 Productivity Growth: Theory and Data

Boyce, James K.—Kinked Exponential Models for Growth Rate Estimation.

A continuous, kinked model for the estimation and comparison of subperiod growth rates is presented. Such models eliminate the "discontinuity bias" inherent in the conventional method of independently estimating growth rates for each subperiod and, hence, provide a better basis for intertemporal and cross-sectional comparisons. *Oxford Bull. Econ. Statist.*, Nov. 1986, 48(4), pp. 385-91. University of Massachusetts at Amherst.

### 300 Domestic Monetary and Fiscal Theory and Institutions

#### 310 DOMESTIC MONETARY AND FINANCIAL THEORY AND INSTITUTIONS

Dini, Lamberto.—Towards a European Integrated Financial Market

The paper reviews innovation in financial markets in recent years and discusses related policy issues, notably the increased complexity of risk management and control by intermediaries and private agents, the revisions required in regulatory and supervisory structures, the consequences of innovation for the effectiveness of monetary policy. The ongoing process of liberalization of capital movements in Europe is then discussed. Differing prudential regulations and controls of financial markets and intermediaries are seen as obstacles to full financial integration, to be overcome through a combination of institutional harmonization and the mutual recognition of the different operating features and techniques. *Banca Naz. Lavoro Quart. Rev.*, Dec. 1986, (159), pp. 377–89. Bank of Italy, Rome.

Wilson, J. S. G.—A Money Market for Thailand?

Following an outline of money market prerequisites and of the Thai banking and financial system, this article examines present arrangements—the interbank market, the role of the Bank of Thailand and its open market operations (based on repurchase agreements), the limited role of Treasury bills and the Transferable Certificate of Deposit, and the possible use of bankers' acceptances and the new Citinote. Reference is also made to the Asian dollar and currency markets. Finally, the article considers how best to develop further the money market in Thailand. *Banca Naz. Lavoro Quart. Rev.*, Sept. 1986, (158), pp. 299–317. University of Hull.

#### 311 Domestic Monetary and Financial Theory and Policy

Andersen, Torben M.—Differential Information and the Role for an Active Stabilization Policy

The paper considers the possibility of pursuing a systematic monetary policy to overcome

the coordination problems arising when agents have differential information. It is shown that a monetary feedback rule involving current feedback, but no prospective feedback, can eliminate the information problem by making the implications of the differential information immaterial for real allocations. The paper also considers a private indexation scheme as a substitute for monetary policy, and it is shown that they differ since indexation on currently known variables is neutral. Indexation of a prospective nature is, however, equivalent to a prospective feedback to the money supply. *Economica*, Aug. 1986, 53(211), pp. 321–38. University of Aarhus, Denmark.

Barnett, William A.; Hinich, Melvin J. and Weber, Warren E.—The Regulatory Wedge between the Demand-Side and Supply-Side Aggregation—Theoretic Monetary Aggregates

William A. Barnett introduced the use of neo-classical demand-side aggregation theory into monetary economics. More recently he has introduced supply side aggregation theory into monetary economics. It is shown that the demand-side and supply-side exact monetary aggregates need not be equal, even if aggregation is over the same component assets on both sides of the market and if all component-asset markets are cleared. The nonpayment of interest on required reserves produces a classical regulatory wedge between the two sides of the aggregate market. Time-series methods, including a new Hilbert transform method, are used to investigate the empirical importance of this aggregate gap. *J. Econometrics*, Oct./Nov. 1986, 33(1/2), pp. 165–85. University of Texas; University of Texas; Federal Reserve Bank of Minneapolis.

Bradley, Michael D. and Jansen, Dennis W.—Deposit Market Deregulation and Interest Rates

The existence of high interest rates during the current period of financial deregulation has led some to argue that deregulation has caused interest rates to rise. In this paper the authors analyze an important aspect of this assertion. In particular, they examine the impact of deposit market deregulation (as manifest by re-

lured ceilings on explicit deposit rates) on deposit and loan rates and find that appropriate consideration of competitively determined implicit interest payments on deposits leads to the conclusion that deposit market deregulation lowers loan and total (implicit plus explicit) deposit rates. *Southern Econ. J.*, Oct. 1986, 53(2), pp. 478-89. George Washington University; Texas A&M University.

Cornell, Bradford and French, Kenneth R.—Commodity Own Rates, Real Interest Rates, and Money Supply Announcements

This paper develops a measure of the real interest rate that is based on commodity own rates—the rate at which one can contract to exchange units of a commodity today for units of the commodity in the future. This measure is used to study the impact of money supply announcements on the real interest rate. The authors find that money shocks have little effect on one- and three-month real interest rates. However, there is a strong positive relation between money shocks and six- and twelve-month real interest rates. *J. Monet. Econ.*, July 1986, 18(1), pp. 3-20. University of California, Los Angeles; University of Chicago.

Culbertson, W. Patton, Jr. and Koray, Faik—Interest Rates, the Forward Premium, and Unanticipated Money

This paper examines why interest rates rise when the Federal Reserve announces a money supply greater than anticipated and explains this phenomenon by a rise in the real interest rate. This differs from previous works based on the assumption of sticky prices by introducing a flexible price model. It is shown that a negative correlation between the forward premium on foreign exchange and an unanticipated increase in the announced money supply implies a rise in the real interest rate and, hence, a rise in nominal interest rates. This implication is tested for five bilateral exchange rates. Supporting evidence is found. *Southern Econ. J.*, Oct. 1986, 53(2), pp. 383-99. Louisiana State University.

Cuthbertson, Keith—Price Expectations and Lags in the Demand for Money

The paper deals with the testing of expectations, adjustment, and structural parameters in

the context of studies of the demand for money. The nominal partial adjustment model is shown to impose a "steady state" inflation effect, but tests of the hypothesis frequently fail to take adequate account of autocorrelation and expectations about the price level. The autoregressive distributed-lag (ADL) approach allows a test of inflation effects, but if agents use rational expectations the steady state solution of the estimated ADL equation may be misleading. In an equation with future expectations variables or an ADL equation containing expectations variables, it is possible to identify and test expectations, adjustment, and structural parameters. *Scott. J. Polit. Econ.*, Nov. 1986, 33(4), pp. 334-54. University of Newcastle upon Tyne.

Dutkowsky, Donald H. and Atesoglu, H. Sonmez—Unanticipated Money Growth and Unemployment: Post-Sample Forecasts

This paper examines one year ahead forecasts of the original and modified Barro unemployment equations for the 1974-84 period. One year ahead predictions indicate that the equations accurately forecast unemployment for 1974-79. During 1980-84, both equations suffer significant structural breakdown and systematically underpredict unemployment. Augmenting the Barro equations with interest rate volatility considerably improves the model's forecasting ability throughout and rectifies the structural instability. The augmented equations also uphold much of the conclusions of the previous Barro work. The results indicate a promising direction for improving the Barro unemployment equations. *Southern Econ. J.*, Oct. 1986, 53(2), pp. 413-21. Syracuse University; Clarkson University, Potsdam, New York.

Eden, Benjamin—Trading Uncertainty and the Cash-in-Advance Constraint

It is argued that when money and bonds are distinct and money yields a lower rate of return, the quantity of private bonds that is exchanged for money is a signal for demand in the near future. Therefore, competitive price setters who observe transactions in the capital market will find it easier to quote prices when money and bonds are distinct, relative to the case in

which money and bonds are perfect substitutes. In the example analyzed, imposing a cash-in-advance constraint leads to fewer price-setting mistakes and to a Pareto improvement. *J. Monet. Econ.*, Nov. 1986, 18(3), pp. 285-93. University of Iowa.

**Evans, Paul—Interest Rates and Expected Future Budget Deficits in the United States**

It is widely believed that larger budget deficits—whether occurring in the past or present or expected to occur in the future—spell higher interest rates. Using three statistical techniques, this paper presents evidence inconsistent with this belief. Ricardian equivalence may explain why larger budget deficits are not associated with higher interest rates. *J. Polit. Econ.*, Feb. 1987, 95(1), pp. 34-58. University of Houston.

**Foster, Gladys Parker—The Endogeneity of Money and Keynes's *General Theory***

The article refutes the monetarist position that the quantity of money is exogenously determined, shows how Keynes's presentation of money as exogeneously determined provided a rationale for attacks on *The General Theory*, and demonstrates that only an endogenous theory of money is consistent with Keynes's central thesis on income and employment. The nature of the relationship between saving and investment posited by Keynes requires the creation of credit, i.e., money, for financing investment. The approach of the article is largely theoretical, but draws upon the empirical literature as a check on the theory. *J. Econ. Issues*, Dec. 1986, 20(4), pp. 953-68. University of Colorado, Denver.

**Greenfield, Robert L. and Yeager, Leland B.—Money and Credit Confused: An Appraisal of Economic Doctrine and Federal Reserve Procedure**

Money's distinctiveness as the medium of exchange places the money stock outside the realm of ordinary supply-and-demand analysis. The portrayal of the quantity of money as a supply-and-demand-determined magnitude does not merely "perpetuate the ancient confusion between money and credit," to quote Karl

Brunner. It actually *identifies* the demand for money with the demand for credit. Nevertheless, much of the literature on monetary policy portrays the quantity of money in just this fashion. Indeed, the erroneous doctrine forms the cornerstone of Federal Reserve operating procedure, setting the stage for perverse changes in the quantity of money. *Southern Econ. J.*, Oct. 1986, 53(2), pp. 364-73. Fairleigh Dickinson University; Auburn University.

**Hansson, Ingemar and Stuart, Charles—The Fisher Hypothesis and International Capital Markets**

In a closed economy with interest taxes at rate  $\tau$  and with a constant real net rate of interest, the nominal rate of interest should rise by  $1/(1 - \tau)$  points for every point rise in the expected rate of inflation. However, a large body of empirical work examines the determinants of nominal interest rates and generally finds that the coefficient of expected inflation is close to or less than one. The authors model the determination of interest rates in an open economy with taxes. Under plausible conditions, increases in inflation cause the nominal interest rate to rise roughly point for point. This suggests that open-capital-market considerations are central for understanding aggregate economic behavior. *J. Polit. Econ.*, Dec. 1986, 94(6), pp. 1330-37. University of Lund, Sweden; University of California, Santa Barbara.

**Hayakawa, Hiroaki—Intertemporal Optimization and Neutrality of Money in Growth Models**

This paper examines the question of the non-neutrality of money in normative monetary growth models in which the desired paths of consumption and asset accumulation are derived from intertemporal optimization considerations. With the inflation rate determined from the requirement that the *ex ante* excess flow demand for goods be closed partially or completely by the price adjustment, it is shown that the neutrality of money in such models is invariant to the differences between the neo-classical and the Keynes-Wicksellian market structures. *J. Monet. Econ.*, Nov. 1986, 18(3), pp. 323-28. University of Georgia; Nagoya Gakuin University, Seto, Japan.

**Hueta, Pierre-Yves and Zylberberg, André**—Contrats indexés dans une économie monétaire (Indexed Contracts in a Monetary Economy)

This paper is devoted to a systematic analysis of indexed contracts in a monetary economy. Using an overlapping generation model, it assumes successively perfect and imperfect information about random disturbances affecting the economy. Beyond the traditional distinction between real and monetary shocks, the emphasis is put on distributive neutrality of money and on the degree of persistency of various shocks. It results from the paper that the contractual degree of indexation, far from being structural as assumed in Keynesian models, is related to economic policy parameters. *Ann. Econ. Statist.*, Apr./June 1986, (2), pp. 147-63 (French). University of Paris-I.

**Kohn, Meir**—Monetary Analysis, the Equilibrium Method, and Keynes's "General Theory"

Compared with the work of his contemporaries, Keynes's *General Theory* represented a radical change in theoretical method—from sequence analysis to the method of equilibrium. The nature of this change is discussed, together with its implications for the substance of Keynes's message and for the subsequent development of macroeconomics. *J. Polit. Econ.*, Dec. 1986, 94(6), pp. 1191-1224. Dartmouth College.

**Lavoie, Marc**—Systemic Financial Fragility: A Simplified View

The paper provides a simple model of four equations, which allows one to interpret the complex financial-fragility hypothesis of H. P. Minsky within a macroeconomic setting. The model shows how accelerating growth rates may lead to heavier leverage ratios and higher profit margins. The latter is then related to accelerating inflation, with or without a feedback mechanism based on the notion of a conventional fair income share. This, in turn, explains why investment booms may lead to high interest rates, although the money supply is strictly endogenous. *J. Post Keynesian Econ.*, Winter 1986-87, 9(2), pp. 286-304. University of Ottawa.

**Loderer, Claudio, Lys, Thomas and Schweitzer, Urs**—Daily Monetary Impulses and Security Prices

This paper uses Swiss data to study the real long-run effects of monetary policy. Daily unexpected changes in the monetary base are found to be negatively correlated with security price changes. This result is unaffected when, implicitly following Robert Geake and Richard Roll (1983), the authors try to measure the autonomous component of monetary policy by taking into account a reaction function of monetary policy to changes in real variables. *J. Monet. Econ.*, July 1986, 18(1), pp. 33-47. Purdue University; Northwestern University; Bühler Bros. Ltd., Uzwil, Switzerland.

**Lubrano, M. and Pierse, R. G. and Richard, J.-F.**—Stability of a U.K. Money Demand Equation: A Bayesian Approach to Testing Exogeneity

The paper analyzes an M3 demand for money equation for the United Kingdom. Attention is paid to the policy change that occurred in 1971 with the introduction of the measures known as Competition and Credit Control. Classical and Bayesian single-equation instrumental variables procedures are developed to investigate the exogeneity of the short-term interest rate and the constancy of the parameters of the underlying relationships. The parameters of the short-term equation have changed as well as the exogeneity status of the interest rate variable but the parameters of the long-term equation appear to be less affected by the policy change. *Rev. Econ. Stud.*, Aug. 1986, 53(4), pp. 603-34. GREQE, University of Aix-Marseille; University of Cambridge; CORE, Catholic University of Louvain.

**McCafferty, Stephen**—Aggregate Demand and Interest Rates: A Macroeconomic Approach to the Term Structure

This paper develops a model in which the term structure of interest rates obtains as an equilibrium outcome of the interactions of firms, households, and rationally informed speculators. Exogenous disturbances whose impact effects fall only in the market for short-term bonds generate equilibrium movements in the yield on long term bonds and the level

of investment spending. In the case of risk-averse speculators, a purely transitory, unanticipated shock to the money supply generates a long distributed-lag effect on the level of aggregate demand. *Econ. Inquiry*, Oct. 1986, 24(4), pp. 521-33. Ohio State University.

**McGibany, James M. and Nourzad, Farrokh—**  
Interest Rate Volatility and the Demand for Money

This article provided evidence that interest rate volatility exerts a direct influence on money demand. This implies that money demand may have been one of the channels of influence through which increased interest rate volatility adversely affected aggregate demand and, therefore, output since 1979. In addition, the effects of anticipated and unanticipated volatility on money demand were found to be inseparable. *Quart. Rev. Econ. Bus.*, Autumn 1986, 26(3), pp. 73-83. Marquette University.

**Merrick, John J., Jr. and Saunders, Anthony—**  
International Expected Real Interest Rates: New Tests of the Parity Hypothesis and U.S. Fiscal Policy Effects

This paper investigates the links among expected real interest rates across countries and also those between international expected real interest rates and U.S. fiscal policy. The authors analyze the cross-sectional mean of international *ex post* real interest rates as an estimator for the mean international expected real interest rate. The results strongly reject the international expected real interest rate parity hypothesis; reveal that U.S. budget deficits have no independent effects on international real rates given the impact of U.S. government defense spending; and suggest that forces other than U.S. fiscal policy account for the post-1980 rise in international real rates. *J. Monet. Econ.*, Nov. 1986, 18(3), pp. 313-22. New York University.

**Miller, Edward M.—**Implications of Multiple Motives for Holding Bank Money

The standard Keynesian system includes both a fixed money supply (M-MO) and a speculative and transaction demand for money. However, a rational bank depositor would hold his speculative and transaction funds in different types

of accounts. Funds held for transaction deposits would be in checking accounts against which checks can be written (the cost of which likely would lead banks to offer no or little interest), while funds that are an alternative to bonds would be held in accounts designed to attract such funds. If the reserve ratio on the different types of accounts differ, as they do in the United States, such shifts of funds would change the money supply, a conclusion inconsistent with the assumed constancy of the money supply. Thus, the standard textbook treatment is logically inconsistent. Once this inconsistency is remedied, Keynesian and monetarist models are much closer to one another. *Quart. Rev. Econ. Bus.*, Autumn 1986, 26(3), pp. 84-104. University of New Orleans.

**Minford, Patrick—**Rational Expectations and Monetary Policy

This essay considers how rational expectations changed the evaluation of monetary policy. The first section reviews underpinnings of the "Phillips curve" relation between inflation and output. The second section examines implications of: (1) the government budget constraint and (2) long-term stationarity of the government debt/GDP ratio. The third section reviews monetary stabilization policy. "Policy effectiveness" will in general exist in rational expectations models, despite the early counter example of T. J. Sargent and N. Wallace. The real problems relate to the desirability of such policy. The essay concludes that rational expectations have made monetary institutions "more of a mystery than ever before." *Scott. J. Polit. Econ.*, Nov. 1986, 33(4), pp. 317-33. University of Liverpool.

**Myatt, Anthony E. and Young, Gregory—**Interest Rates and Inflation: Uncertainty Cushions, Threshold and "Patman" Effects

Recent theoretical results suggest that interest rate increases may cause inflationary price increases and make instability more likely. Using the Wald variant of the Granger test, the authors find no evidence of interest rates (real or nominal) having a causal impact on inflation. There is, however, strong evidence of a causal link from inflation to both real and nominal interest rates. Evidence of threshold effects in

the public's perception of inflation is found. It is also shown that the increased variability of inflation can explain the entire increase in real *ex ante* interest rates in the post-1978 period. *Eastern Econ. J.*, Apr.-June 1986, 12(2), pp. 103-14. University of New Brunswick; Bank of Montreal.

Neumann, Manfred J. M.—Die Grundgeldmenge—Ein neuer Indikator der Geldpolitik (The Base Money Stock—A New Indicator of Monetary Policy)

This paper analyzes the indicator properties of alternative base money concepts used by the German Council of Economic Experts and by the Deutsche Bundesbank. Both concepts are flawed by an inadequate treatment of changes in legal reserve requirements. As a result, the direct contribution of monetary policy to money growth has been continuously understated by the Council's indicator, during recent years, while the Bundesbank's central bank money stock has understated (1983, 1984) and overstated (1982, 1985) the policy contribution. Finally, a superior base money measure is proposed which combines the source base with a multiplier based on a logarithmic reserve adjustment. *Weltwirtschaft. Arch.*, 1986, 122(3), pp. 520-33 (German). Institut für Stabilisierungs- und Strukturpolitik, Bonn.

Paul, M. Thomas and Bhattacharyay, Biswa N.—Can Money Matter in a Developing Economy?

This study demonstrates that the productivity of real money balances is small in two developing countries (India and Pakistan), using a methodology due to Richard Startz (1984). *J. Monet. Econ.*, Sept. 1986, 18(2), pp. 205-07. National Institute of Bank Management, Pune, India.

Smith, Bruce—Limited Information, Money, and Competitive Equilibrium

In an overlapping generations model with borrowing and lending, uncertainty, and asymmetric information, fiat money may be essential to the existence of a competitive equilibrium. It may also serve to enhance the information of economic agents in a well defined sense. In addition, the model presented provides suggestions about why the presence of valued fiat cur-

rency is essential to the existence of an equilibrium, even though in equilibrium perfect substitutes for money may exist. Finally, the presence of private information, and the existence problems it creates, is shown to affect standard conclusions in these models about "optimal" government policy choices. *Can. J. Econ.*, Nov. 1986, 19(4), pp. 780-97. Carnegie-Mellon University and Federal Reserve Bank of Minneapolis.

Summers, Lawrence H.—Estimating the Long-run Relationship between Interest Rates and Inflation: A Response

This note demonstrates that Bennett McCallum's recent critique of low-frequency estimates of macroeconomic relationships is of little empirical significance. It also demonstrates that readily available and frequently used techniques can be used to diagnose the problem McCallum raises. Finally, it shows that the standard critique of expectational distributed lags is not warranted once the role of learning by economic agents is recognized. *J. Monet. Econ.*, July 1986, 18(1), pp. 77-86. Harvard University.

Taylor, Herb—Deposit Market Deregulation and the Recent Behavior of M1

The recent pattern of errors from standard money demand equations makes it difficult to attribute their breakdown to deposit market deregulation. But deregulation's role may be obscured by seasonal filtering of the data, inappropriate measurement of households' opportunity cost of holding money, and aggregation bias. Estimates of not seasonally adjusted household money demand using the Demand Deposit Ownership Survey data suggest that deregulation has affected by money demand by changing households' opportunity cost of holding money. In addition, the introduction of nationwide NOWs and Super NOWs each seems to have caused significant one-time increases in household money demand. *Eastern Econ. J.*, July-Sept. 1986, 12(3), pp. 307-12. Federal Reserve Bank of Philadelphia.

Terzi, Andrea—The Independence of Finance from Saving: A Flow-of-Funds Interpretation

Keynes's proposition about the independence of finance from saving is rejected by those econ-

omists, policymakers, and commentators who adhere to the loanable funds theory of interest. For the latter, saving and lending activity provides a net source of funds to the capital market. This paper provides a flow-of-funds model where the flow of household savings, even when it is entirely used to purchase securities, is not a net component of the supply of funds in the capital market. Thus, households' consumption and saving decisions are shown to be irrelevant for the conditions of finance faced by investors. *J. Post Keynesian Econ.*, Winter 1986-87, 9(2), pp. 188-97. Franklin College, Lugano-Sorengo, Switzerland.

**Williamson, Stephen D.**—Costly Monitoring, Financial Intermediation, and Equilibrium Credit Rationing

This paper establishes a link between equilibrium credit rationing and financial intermediation in a model with asymmetrically informed lenders and borrowers, costly monitoring, and investment project indivisibilities. Intermediation is shown to dominate borrowing and lending between individuals, and these financial intermediaries exhibit several of the important features of intermediaries as we know them. Equilibrium interest rates and the aggregate quantity of loans respond quite differently to changes in taste and technology parameters, depending on whether or not there is rationing in equilibrium. *J. Monet. Econ.*, Sept. 1986, 18(2), pp. 159-79. Queen's University, Kingston, Ontario and University of Western Ontario, London, Ontario.

**Williamson, Stephen D.**—Increasing Returns to Scale in Financial Intermediation and the Non-neutrality of Government Policy

A general equilibrium model of imperfectly competitive financial intermediaries is constructed and used to study the effects of some standard policy experiments. One-time increases in the growth rate and in the level of the stock of money have nonneutral (and sometimes surprising) effects on interest rates, the quantity of intermediated borrowing and lending, the number of intermediary firms, inflation and the price level. Optimal government macroeconomic policy is shown to reflect a tradeoff between public sector frictions and the capital

market distortion created by increasing returns to scale and imperfect competition in private intermediation. *Rev. Econ. Stud.*, Oct. 1986, 53(5), pp. 863-75. Queen's University and University of Western Ontario.

### 312 Commercial Banking

**Clark, Jeffrey A.**—Single-Equation, Multiple-Regression Methodology: Is It an Appropriate Methodology for the Estimation of the Structure-Performance Relationship in Banking?

Tests of the structure-performance paradigm of the industrial organization literature have been carried out almost exclusively using a single-equation, multiple-regression methodology. The purpose of this paper is to suggest that where the firms being considered are multiple product in nature, and may pursue objectives in addition to maximizing the value of the firm, such a methodology may be inappropriate. The results presented in this paper suggest that the absence of a consistently strong, positive, and statistically significant relationship between market concentration and bank profitability may be traced in part to such an inappropriate methodology. *J. Monet. Econ.*, Nov. 1986, 18(3), pp. 295-312. Florida State University.

**Kim, Moshe**—Banking Technology and the Existence of a Consistent Output Aggregate

This paper addresses the question of the existence of a consistent output aggregate in banking. Specific, necessary and sufficient conditions for output aggregation are developed and tested in the context of a second-order approximation to any arbitrary multiproduct bank cost function. The analysis provides evidence that a composite (aggregate) measure of output fails to provide a proper representation of banking technology and, therefore, previous studies that used aggregate output measures may well be subject to specification errors. *J. Monet. Econ.*, Sept. 1986, 18(2), pp. 181-95. University of Haifa, Israel.

**Müller, Albert**—Risikoeinschätzung und Bankverhalten (Risk Preferences and the Behavior of Bank Management)

In this paper whether the kind of the risk preferences of a bank management has influ-

once on the comparative static results in a banking model in the tradition of Baltensperger, Niehaus and Ritzmann is analyzed. There are no qualitative differences between these models, when both interest rates of the assets are greater than the interest rate of the liability. *Schweiz. Z. Volkswirtschaft. Statist.*, Sept. 1986, 122(3), pp. 371-87 (German). Schweizerische Bankgesellschaft, Zurich.

**Todhanakasom, Warapatr, et al.**—Economies of Scale and Organization Efficiency in Banking

Previous studies attempting to assess economies of scale in banking firms have largely relied upon cost functions. The profit-function approach enjoys several important advantages over the cost-function method, consequently that is the approach used in this study. A risk-adjusted profit function estimates economies of scale of unit and branch banks; and the effects of bank holding-company affiliation on the level of bank profits is also examined. The results indicate larger economies of scale for branch banks than for unit banks; and bank holding-company affiliates were found to be more efficient than independent banks. Coauthors are Morgan J. Lynge, Jr., Walter J. Primaux, Jr., and Paul Newbold. *Managerial Dec. Econ.*, Dec. 1986, 7(4), pp. 255-62. Thai Farmers Bank, Bangkok, Thailand.

### 313 Capital Markets

**Amihud, Yakov and Mendelson, Haim**—Asset Pricing and the Bid-Ask Spread

This paper studies the effect of the effect of the bid-ask spread on asset pricing. The authors analyze a model in which investors with different expected holding periods trade assets with different relative spreads. The resulting testable hypothesis is that market-observed expected return is an increasing and concave function of the spread. This hypothesis is tested, and the empirical results are consistent with the predictions of the model. *J. Finan. Econ.*, Dec. 1986, 17(2), pp. 223-49. Tel-Aviv University and New York University; University of Rochester.

**Anderson, Seth Copeland**—An Analysis of Trading Strategies for Closed-End Equity Funds

This paper reexamines the trading rules that were the subject of an earlier study by R. M. Richards, Don R. Fraser, and John C. Groth. Closed end investment company share data are investigated for 1965-69, 1970-76, and 1977-August 1984. Using both an alternative return metric and an alternative discount metric in all periods, large returns are obtained when various strategies are implemented. The returns are not significantly more variable than returns of the market for each period. The use of filter rules with prices does not result in consistently profitable filter strategies. The results generally support those of Richards, Fraser, and Groth. *Quart. J. Bus. Econ.*, Winter 1987, 26(1), pp. 3-19. University of Alabama.

**Barone-Adesi, Giovanni and Whaley, Robert E.**—The Valuation of American Call Options and the Expected Ex-Dividend Stock Price Decline

This study focuses on the ex-dividend stock price decline implicit within the valuation of American call options on dividend-paying stocks. The Roll (1977) American call option pricing formula and the observed structure of CBOE call option transaction prices are used to infer the expected ex-dividend stock price decline as a proportion of the amount of the dividend. The relative decline is shown to be not meaningfully different from one, confirming some recent evidence from studies that examined stock prices in the days surrounding ex-dividend. *J. Finan. Econ.*, Sept. 1986, 17(1), pp. 91-111. University of Alberta; Duke University.

**Bauer, Richard J., Jr; Hays, Patrick A. and Upton, David E.**—Parameter Instability in Mutual Fund Portfolios: A Shifting Regimes Test

This study uses a shifting regimes approach to indicate whether instability in the regression parameters of the characteristic line for mutual fund portfolios is present to any great degree. The cumulative sum of squared recursive residuals test, developed by R. L. Brown, J. Durbin, and J. M. Evans, is used to test the stationarity of regression model parameters. The results are compared to those obtained with

the partition regression approach used by W. Miller and W. Gressis. Both studies imply that substantial instability in the regression parameters exists and that this nonstationarity can be modeled as a distinct shift between discrete intervals or regimes of relative parameter instability. *Quart. J. Bus. Econ.*, Winter 1987, 26(1), pp. 50-62. University of Western Ontario; Western Carolina University, Cullowhee, North Carolina; Texas Tech University.

Jenninga, Simon and Protopapadakis, Aris—General Equilibrium Properties of the Term Structure of Interest Rates

The paper examines the allocation of consumption and investment in a three-date binomial model in order to determine the sign of the real term structure premium in general equilibrium. When production functions are concave, markets are complete, and future production possibilities are the same irrespective of which state of the world occurs, the term structure premium will be positive. In incomplete markets, constant or increasing absolute risk aversion is sufficient to guarantee a positive term structure premium, although in the (more likely) case of decreasing absolute risk aversion negative premium cannot be ruled out. *J. Finan. Econ.*, July 1986, 16(3), pp. 389-410. Hebrew University and University of Pennsylvania; Federal Reserve Bank of Philadelphia and University of Pennsylvania.

Green, William; Jagannathan, Ravi and Ofer, Aharon R.—Correcting for Heteroscedasticity in Tests for Market Timing Ability

In this paper the authors examine the parametric test proposed by R. D. Henrikson and E. C. Merton for evaluating the market timing ability of portfolio managers. Using simulation techniques, they show that correction for heteroskedasticity can significantly affect the conclusions. It is also found that the heteroskedasticity corrections suggested by L. P. Hansen and by H. White are particularly effective. *J. Bus.*, Pt. 1, Oct. 1986, 59(4), pp. 585-96. Northwestern University; Northwestern University; Northwestern University and Tel-Aviv University.

Buser, Stephen A. and Hess, Patrick J.—Empirical Determinants of the Relative Yields on Taxable and Tax-Exempt Securities

Yields on short-term, prime-grade municipals vary through time in relation to after-corporate-tax yields on short-term U.S. Treasury securities. The pattern is not related to the default premium in municipal yields or to the historical ceiling on bank deposit rates (Regulation Q). However, there is a strong link to the default premium in corporate yields and to municipal holdings by large commercial banks. These findings suggest that taxable and tax-exempt markets are linked both by the capital-structure decisions of firms and by the tax-arbitrage activities of banks. *J. Finan. Econ.*, Dec. 1986, 17(2), pp. 335-55. Ohio State University; University of Minnesota.

Chan, K. C.—Can Tax-Loss Selling Explain the January Seasonal in Stock Returns?

This paper analyzes the tax-loss selling hypothesis as an explanation of the January seasonal in the stock returns, and argues that rational tax-loss selling implies little relation between the January seasonal and the long-term loss. Empirical results show that the January seasonal is as strongly related to the long-term as it is to the short-term loss. The evidence is inconsistent with a model that explains the January seasonal by optimal tax trading. *J. Finance*, Dec. 1986, 41(5), pp. 1115-28. Ohio State University.

Chang, Eric C. and Pinegar, J. Michael—Return Seasonality and Tax-Loss Selling in the Market for Long-term Government and Corporate Bonds

The authors document a January seasonal in the U.S. market for long-term corporate bonds that becomes more evident as the bond rating declines. Moreover, a similar, but weaker, relation is observed for the stocks of firms with low-quality bonds. These patterns may relate to firm size since bond ratings and firm size in the sample are positively related. However, even the smallest firms are relatively large. Much of the January effect documented appears to be consistent with the tax-loss selling hypothesis. *J. Finan. Econ.*, Dec. 1986, 17(2), pp.

301-415. University of Maryland; University of Iowa.

Chen, Andrew H. and Merville, Larry J.—An Analysis of Divestiture Effects Resulting from Deregulation

Capital market data were used to examine the divestiture effects pertaining to deregulation, the dropping of antitrust charges, and/or the reversing of the co-insurance effect associated with the recent breakup of AT&T. The empirical results of the study indicate that significant economic events took place during the breakup process, which led to transfers of wealth from various parties to the securityholders of AT&T. The results also indicate that the buffering effect of regulation was reduced as AT&T went through the total deregulation process. This is in accordance with S. Peltzman's prediction. *J. Finance*, Dec. 1986, 41(5), pp. 997-1010. Southern Methodist University; University of Texas at Dallas.

Cheng, David C. and Lee, Cheng F.—Ramsey's Specification Error Test and Alternative Specifications of the Market Model: Methods and Applications

The main purpose of this article is to show that the specification error test procedure developed by J. B. Ramsey (1964) and J. B. Ramsey and P. R. Schmidt (1976) can be used to determine empirically whether well known market model specifications are empirically appropriate for estimating individual companies' beta coefficients and forecasting rates of returns. *Quart. Rev. Econ. Bus.*, Autumn 1986, 26(3), pp. 6-24. University of Alabama; University of Illinois.

Coste, Douglas and VanderHoff, James—Stock Returns, Inflation, and Real Output

This paper provides empirical evidence on the extent to which the inverse relationship between real stock returns and inflation in recent years is causal or spurious. The results indicate that this relationship is spurious and can be explained by the inverse correlation between unexpected inflation and unexpected real output. The expected and unexpected real output and inflation variables are generated from the ASANBER Business Outlook Surveys. *Econ.*

*Inquiry*, Oct. 1986, 24(4), pp. 555-61. Rutgers University, Newark, New Jersey.

Darrat, Ali F.—Money and Stock Prices in West Germany and the United Kingdom: Is the Stock Market Efficient?

This paper empirically tests the implication of the stock market efficiency hypothesis that stock prices reflect all publicly available information, including news about monetary policy, for West Germany and the United Kingdom. Contrary to this hypothesis, a significant lagged relationship is found between stock returns and money growth in both countries. The empirical results also indicate the presence of significant lagged effects of unanticipated and anticipated money growth on current stock prices. Such results suggest that the stock markets in both countries appear to be inefficient, at least during the estimation period (1960:1 to 1982:4). *Quart. J. Bus. Econ.*, Winter 1987, 26(1), pp. 20-35. University of New Orleans.

Dietrich-Campbell, Bruce and Schwartz, Eduardo—Valuing Debt Options: Empirical Evidence

A two-factor model using the instantaneous rate of interest and the return on a consol bond to describe the term structure of interest rates (the Brennan-Schwartz model) is used to derive theoretical prices for American call and put options on U.S. government bonds and Treasury bills. These model prices are then compared with market prices. The theoretical model used to value the debt options also provides hedge ratios which may be used to construct zero-investment portfolios which, in theory, are perfectly riskless. Several trading strategies based on these "riskless" portfolios are examined. *J. Finan. Econ.*, July 1986, 16(3), pp. 321-43. New York University; University of British Columbia.

Dimson, Elroy and Marsh, Paul—Event Study Methodologies and the Size Effect: The Case of UK Press Recommendations

This study of 862 press recommendations demonstrates that the size effect can distort longer term performance measures, and hence event studies. Relative to similar sized companies, post-publication performance is neutral. However, market adjustments, the CAPM and

**Market Model**, with equally or capitalization weighted indexes, all produce biased results. Event studies are most exposed to such bias when the measurement interval is long, event securities differ systematically in size or weighting from the index constituents, the size effect is large and/or volatile, and when CAPM-type methodologies are used. These distortions are avoided by explicitly controlling for size. *J. Finan. Econ.*, Sept. 1986, 17(1), pp. 113-42. London Business School.

**Dunn, Kenneth B. and Singleton, Kenneth J.**—Modeling the Term Structure of Interest Rates under Non-separable Utility and Durability of Goods

The term structure relations implied by a model in which preferences are nonseparable functions of the service flows from two goods are investigated. The parameters characterizing preferences are estimated and restrictions on the co-movements of consumption and Treasury bill returns are examined. Both the durability of goods and the nonseparability of preferences are important factors in explaining the time paths of individual returns, but there is substantial evidence against the cross-sectional restrictions implied by this model. Differences between sample mean returns are too large relative to the sample covariances of the return differences and the marginal utility of consumption. *J. Finan. Econ.*, Sept. 1986, 17(1), pp. 27-55. Carnegie-Mellon University; Carnegie-Mellon University and National Bureau of Economic Research.

**Elmer, Peter J.**—Preferred Stock Arbitrage of Municipal Bond Market Segmentation

This paper discusses how tax and regulatory constraints in the municipal bond market can affect preferred-stock yields and give rise to arbitrage opportunities in the preferred-stock market. The potential for profit is illustrated with an example that also serves to highlight the unique characteristics of recently developed forms of preferred stock. *Financial Rev.*, Nov. 1986, 21(4), pp. 383-98. Federal Home Loan Mortgage Corporation.

**Fama, Eugene F.**—Term Premiums and Default Premiums in Money Markets

There are time-varying term and default premiums in the expected returns on money market securities. Default premiums decline with maturity and tend to be higher during recessions. Term premiums tend to increase with maturity during good times, but humps and inversions in the term structure of expected returns are common during recessions. Treasury bills produce positive average term premiums for the overall sample, but average term premiums for private issuer securities are close to 0.0. A general conclusion is that variation in forward rates is primarily variation in current expected returns rather than in forecasts of changes in interest rates. *J. Finan. Econ.*, Sept. 1986, 17(1), pp. 175-96. University of Chicago.

**French, Kenneth R. and Roll, Richard**—Stock Return Variances: The Arrival of Information and the Reaction of Traders

Asset prices are much more volatile during exchange trading hours than during nontrading hours. This paper considers three explanations for this phenomenon: (1) volatility is caused by public information, which is more likely to arrive during normal business hours; (2) volatility is caused by private information, which affects prices when informed investors trade; and (3) volatility is caused by pricing errors that occur during trading. Although a significant fraction of the daily variance is caused by mispricing, the behavior of returns around exchange holidays suggests that the arrival of private information is the principle factor behind high trading-time variances. *J. Finan. Econ.*, Sept. 1986, 17(1), pp. 5-26. University of Chicago; University of California, Los Angeles and Goldman, Sachs & Co., New York.

**Haddad, Kamal M.**—The Treasury's Constant-Maturity Yield Curves: A Test for Systematic Measurement Errors

The U.S. Department of Treasury's published yield series has been a key input into empirical studies of the term structure and bond market efficiency. These indexes also are important inputs into Treasury pricing of new debt issues. Since these yield series are interpolated from yield curves, the yields are open to potential measurement errors. This paper tests for systematic bias in the Treasury's yield curves

by comparing estimates from the Treasury's yield curves to actual market yields on a sample of government securities. For both an exact and inexact maturity sample, the Treasury's published yield series did not differ significantly from actual yields. *Quart. J. Bus. Econ.*, Autumn 1986, 25(4), pp. 3-13. San Diego State University.

Hess, Alan C. and Bhagat, Sanjai—Size Effects of Seasoned Stock Issues: Empirical Evidence

This paper reports estimates of cross-sectional relations between relative issue size and abnormal returns for several periods surrounding the announcement and issue days of seasoned stock offerings. For utility issues there is a significant, positive relative size effect during the announcement period; there are no significant size effects in any other period. For industrial issues, both primary and combination, there are no significant relative size effects in any period. The omitted variable analysis identifies feasible combinations of equity demand schedule slopes, correlations between information and relative issue size, and whether the information signaled by the announcement is good or bad. Utility announcements signal information that is positively correlated with relative issue size. No unambiguous conclusions can be drawn for industrial announcements. *J. Bus.*, Pt. 1, Oct. 1986, 59(4), pp. 567-84. University of Washington; University of Utah.

Ho, Thomas S. Y. and Lee, Sang-bin—Term Structure Movements and Pricing Interest Contingent Claims

This paper derives a general class of arbitrage-free interest rate movements models (AR models). These models take the complete term structure as given and derive the subsequent stochastic movement of the term structure such that the movement is arbitrage free. The authors then show how they can be used to price interest contingent claims relative to the observed complete term structure of interest rates. They also study the behavior and the economics of a particular AR model. This approach can be used to price a broad range of interest rates contingent claims, including bond options and callable bonds. *J. Finance*, Dec.

1986, 41(3), pp. 1011-29. New York University; Korea Economic Research Institute, Seoul.

Holthausen, Robert W. and Leftwich, Richard W.—The Effect of Bond Rating Changes on Common Stock Prices

The evidence in this paper suggests that downgrades by both Moody's and Standard and Poor's are associated with negative abnormal stock returns in the two-day window beginning the day of the press release by the rating agency. Significant negative abnormal performance can still be detected after eliminating observations containing obvious concurrent (potentially contaminating) news releases. There is little evidence of abnormal performance on announcement of an upgrade. Significant abnormal returns are associated with announcements of additions to the Standard and Poor's Credit Watch List, if either a potential downgrade or a potential upgrade is indicated. *J. Finan. Econ.*, Sept. 1986, 17(1), pp. 57-89. University of Chicago.

Huffman, Gregory W.—A Dynamic Equilibrium Model of Asset Prices and Transaction Volume

A dynamic general equilibrium model of capital asset pricing is constructed in which the volume of capital traded is determined endogenously. The model also gives rise to a novel asset pricing formula. It is shown that temporary shocks can give rise to serially correlated changes in the price of capital and transaction volume that persist long after the initial disturbance. The frequency and amplitude of the resulting cycles are related to the length of the agent's planning horizon and the discount factor. The model's implications for explaining asset price volatility are also explored. *J. Polit. Econ.*, Feb. 1987, 95(1), pp. 138-59. University of Western Ontario, London, Ontario.

Kalay, Avner and Loewenstein, Uri—The Informational Content of the Timing of Dividend Announcements

This paper contains a test of a new aspect of the informational content of dividends; namely, is there information in the timing of the announcements. The empirical evidence indicates that the market expects "bad news" to be deliv-

ered late and that these expectations are confirmed. Mean excess returns of stock prices around late announcements are, depending on the assumed returns generating process, either significantly negative or insignificant while significantly positive around the entire population of announcements. Moreover, the proportion and magnitude of dividend reductions associated with late announcements are significantly larger than the complete universe of announcements. *J. Finan. Econ.*, July 1986, 16(3), pp. 373-88. New York University and Tel-Aviv University; University of Utah.

**Karpoff, Jonathan M.—A Theory of Trading Volume**

The theory describes two distinct ways informational events can affect trading volume: investors disagree about the information or have different prior expectations about it. Simulation tests support the model, and are used to contrast costless market clearing with a trading environment in which information is costly and agents randomly encounter potential trading partners. Volume is lower in the costly market, and increases in volume caused by an informational event persisting after the event period. This is consistent with existing empirical evidence, and suggests that markets do not immediately clear all orders or that investors have demands to recontract. *J. Finance*, Dec. 1986, 41(5), pp. 1069-87. University of Washington, Seattle.

**Keim, Donald B. and Stambaugh, Robert F.—Predicting Returns in the Stock and Bond Markets**

Several predetermined variables that reflect levels of bond and stock prices appear to predict returns on common stocks of firms of various sizes, long-term bonds of various default risks, and default-free bonds of various maturities. The returns on small-firm stocks and low-grade bonds are more highly correlated in January than in the rest of the year with previous levels of asset prices, especially prices of small-firm stocks. Seasonality is found in several conditional risk measures, but such seasonality is unlikely to explain, and in some cases is opposite to, the seasonal found in mean returns. *J. Finan. Econ.*, Dec. 1986, 17(2), pp. 357-90.

University of Pennsylvania; University of Chicago.

**Kleidon, Allan W.—Anomalies in Financial Economics: Blueprint for Change?**

This paper examines the case for major changes in the behavioral assumptions underlying economic models, based on apparent anomalies in financial economics. Arguments for such changes based on claims of "excess volatility" in stock prices appear flawed for two main reasons: there are serious questions as to whether the phenomenon exists in the first place; and even if it did exist, whether radical change in behavioral assumptions is the best avenue for current research. The paper also examines other apparent anomalies, and suggests conditions under which such behavioral changes are more or less likely to be adopted. *J. Bus.*, Pt. 2, Oct. 1986, 59(4), pp. 5469-99. Stanford University.

**Lakonishok, Josef and Vermaelen, Theo—Tax-Induced Trading around Ex-dividend Days**

This paper investigates trading volume and around ex-dividend days. For taxable distributions (cash dividends), it is found that trading volume increases significantly around the ex-dividend day. This increase is more pronounced for high-yield, actively traded stocks and after brokerage commissions became negotiable. The results are consistent with the hypothesis that short-term traders have an impact on ex-day price behavior, at least for taxable distributions. For nontaxable distributions (stock splits and stock dividends), the authors find negative abnormal volume around ex-day. *J. Finan. Econ.*, July 1986, 16(3), pp. 287-319. Tel-Aviv University and Cornell University; Catholic University of Leuven.

**Langohr, Herwig M. and Viallet, Claude J.—Compensation and Wealth Transfers in the French Nationalizations: 1961-1982**

This paper studies the price reaction of French common stocks to the recent nationalization program and estimates the value that nationalized firms would have had if the nationalization program had not occurred. It finds that expropriated holders of the nationalized portfolio received a government-legislated takeover

premium of about 30 percent. Premiums received for individual firms ranged from -3 to 44 percent. Industrial firm shareholders benefited most from the program. The conditions surrounding the premium dispersion raise questions about equal treatment among expropriated shareholders. *J. Finan. Econ.*, Dec. 1986, 17(2), pp. 273-312. INSEAD, Fontainebleau, France.

**Lo, Andrew W.**—Statistical Tests of Contingent-Claims Asset-Pricing Models: A New Methodology

A new methodology for statistically testing contingent claims asset-pricing models based on asymptotic statistical theory is proposed. It is introduced in the context of the Black-Scholes option pricing model, for which some illustrative estimation, inference, and simulation results are also presented. The proposed methodology is then extended to arbitrary contingent claims by first considering the estimation problem for general Ito processes and then deriving the asymptotic distribution of a general contingent claim which depends upon such Ito processes. *J. Finan. Econ.*, Sept. 1986, 17(1), pp. 143-73. University of Pennsylvania.

**Mankiw, N. Gregory**—The Equity Premium and the Concentration of Aggregate Shocks

This paper examines an economy in which aggregate shocks are not dispersed equally throughout the population. Instead, while these shocks affect all individuals *ex ante*, they are concentrated among a few *ex post*. The equity premium in general depends on the concentration of these aggregate shocks; it follows that one cannot estimate the degree of risk aversion from aggregate data alone. These findings suggest that the empirical usefulness of aggregation theorems for capital asset pricing models is limited. *J. Finan. Econ.*, Sept. 1986, 17(1), pp. 211-19. Harvard University and National Bureau of Economic Research.

**Narayananwamy, C. R. and Phillips, Herbert E.**—CAPM, Valuation of Firms, and Financial Leverage

The irrelevance of capital structure in determining the value of the firm first was demonstrated by Franco Modigliani and M. Miller.

Using the capital asset pricing model, R. Hamada shows that the assumption of homogenous risk class is not necessary for the validity of the Modigliani and Miller propositions. Hamada's proof, however, applies only to the case of a single firm altering its financial leverage. This paper generalizes Hamada's results to the multifirm case. An implication is that the systematic risk of the stocks is affected by the financial leverage of all firms, in addition to the firm's financial leverage. Further, changes in the financial leverage of firms can alter the distribution of returns of the market portfolio. *Quart. J. Bus. Econ.*, Winter 1987, 26(1), pp. 86-93. University of Akron; Temple University.

**Pruitt, Stephen W.; Reilly, Robert J. and Hoffer, George E.**—Security Market Anticipation of Consumer Preference Shifts: The Case of Automotive Recalls

This study presents an empirical analysis of the financial impact of automotive recall announcements on the equity holders of the firm's domestic and foreign competitors. Because earlier research has documented both sales increases and decreases for competitive models following automotive recalls (depending upon the classification and time period of the announcement), the study was designed specifically to determine the market's ability to properly discriminate at the time of announcement between virtually identical recall events which were later determined to have resulted in differential *ex post* realizations. *Quart. J. Bus. Econ.*, Autumn 1986, 25(4), pp. 14-28. University of North Florida; Virginia Commonwealth University; Virginia Commonwealth University.

**Smirlock, Michael and Starks, Laura**—Day-of-the-Week and Intraday Effects in Stock Returns

This study examines day-of-the-week effects using hourly values of the Dow Jones Industrial Average. The authors find that over the 1963-83 period the weekend effect has shifted from characterizing active trading on Monday to characterizing the nontrading weekend. Over the early part of our sample period negative returns characterize each hour of trading on Monday while the return from Friday close to

Monday open is positive. In the most recent subperiod, Monday average hourly returns after noon are all positive and the weekend effect is due to negative average returns from Friday close to Monday open. *J. Finan. Econ.*, Sept. 1986, 17(1), pp. 197-210. University of Pennsylvania; Washington University, St. Louis.

### 314 Financial Intermediaries

**Brickley, James A. and James, Christopher M.**—Access to Deposit Insurance, Insolvency Rules and the Stock Returns of Financial Institutions

This paper analyzes how access to deposit insurance affects the common stock returns of financial institutions during periods of financial distress. During periods of distress the definition of insolvency used by insuring agencies may be modified to avoid a substantial number of bank failures. These modifications can increase the value of future deposit guarantees and affect the behavior of stock returns of banks and S&Ls. This hypothesis is examined using S&L data for the 1976 through 1983 period. Modification of insolvency rules applied to S&Ls appears to have reduced significantly the co-movement of S&L stock returns with S&L portfolio holdings. *J. Finan. Econ.*, July 1986, 16(3), pp. 345-71. University of Utah; University of Oregon.

### 315 Credit to Business, Consumer, etc. (including mortgages)

**Ramaswamy, Krishna and Sundaresan, Suresh M.**—The Valuation of Floating-Rate Instruments: Theory and Evidence

A framework for valuing floating-rate notes is developed to examine the effects of: (1) lags in the coupon formula; (2) special contractual features; and (3) default risk. Evidence from a sample of floaters indicates they sold at significant discounts. While lags in the coupon formulas and other contractual features make these notes more variable, they do not account for the magnitude of the discounts. The authors conclude that the fixed default premium in the coupon formula of a typical note is inadequate to compensate for time-varying default premiums demanded by investors, who treat other corporate short-term paper as close substitutes. *J. Finan. Econ.*, Dec. 1986, 17(2), pp. 251-72.

University of Pennsylvania; Columbia University.

### 320 FISCAL THEORY AND POLICY; PUBLIC FINANCE

#### 321 Fiscal Theory and Policy

**Batina, Raymond G.**—The Optimal Linear Income Tax with Tax Credits Contingent on Fertility

The literature on the optimal linear income tax is extended by incorporating tax credits contingent on the number of dependents the taxpayer is responsible for. The choice over how many dependents to be responsible for is made endogenous by allowing the taxpayer choice over their own fertility. Formulae are derived governing the government's optimal choice of the labor income tax rate and the tax credit contingent on fertility. If the government ignores fertility behavior, it will choose a lower than optimal tax rate on labor under certain conditions. *J. Public Econ.*, July 1986, 30(2), pp. 219-35. Washington State University, Pullman, Washington.

**Bhatia, Kul B.**—Taxes, Intermediate Goods, and Relative Prices: The Case of Variable Coefficients

Price effects of an output tax in one industry and an equivalent subsidy in the second industry are analyzed in a general equilibrium model. Each commodity satisfies final demand and uses two primary inputs and the other good as an intermediate product. Production coefficients are variable and demand is elastic. In a Leontief model with fixed coefficients, L. A. Metzler showed that price of the taxed good will rise and price of the subsidized good will fall. This result holds under less restrictive conditions also, although it is sometimes reversed. How the topic relates to the tax incidence literature is also discussed. *J. Public Econ.*, Nov. 1986, 31(2), pp. 197-213. University of Western Ontario, London, Ontario.

**Caniglia, Alan S.**—A Common Fallacy about In-Kind Subsidies: A Housing Programs Application

A general conclusion in public finance is that a recipient's level of well being will be smaller with an in-kind subsidy than with a cash grant of equal size. This paper shows that this is not

necessarily the case when the in-kind subsidy is of a public good within a recipient collectivity. This may occur if a locality is the recipient of an intergovernmental grant or a family is the recipient of benefits under a welfare program, and is caused by the presence of the public good and the collective decision-making process that results. *Eastern Econ. J.*, Apr.-June 1986, 12(2), pp. 149-57. Franklin and Marshall College.

**Cunningham, Thomas J.—Growing Out of Deficits: Debt Dynamics in a Disequilibrium Model**

This paper presents a model of income and government debt dynamics in a stylized, Keynesian economy. The purpose of the discussion is to describe certain conditions under which the economy will grow out of a present government deficit as it approaches its equilibrium. The conditions are applied to the beginning of the "supply-side" fiscal experiment in the early 1980s, as well as more recent economic conditions. *J. Post Keynesian Econ.*, Winter 1986-87, 9(2), pp. 297-306. Federal Reserve Bank of Atlanta.

**Erbas, S. Nuri—Inflationary Finance of Budget Deficits as an Automatic Stabilizer**

A rational expectations model is presented to generalize B. T. McCallum and J. K. Witter's (1979) model. The model demonstrates the effectiveness and stability of the full-employment budget deficit and of inflationary finance used to finance this deficit as automatic stabilizers in the determination of current income under rational expectations. Within the same model the problem of optimal dynamic stochastic monetary policy is also briefly explored. *J. Monet. Econ.*, Sept. 1986, 18(2), pp. 197-204. University of Houston—University Park.

**Feltenstein, Andrew—An Intertemporal General Equilibrium Analysis of Financial Crowding Out: A Policy Model and an Application to Australia**

This paper constructs a two-period, perfect foresight general equilibrium model that analyzes crowding out. Private investment is debt financed, while government deficits are financed by money and debt. The existence of

equilibrium is demonstrated and the model is applied to Australia for 1981-82, the last years for which Australia had a fixed exchange rate. A benchmark solution is derived and two counterfactual simulations are carried out. Small increases in real government spending are found not to lead to crowding out, while an increase in the debt financed portion of the government's budget deficit does lead to crowding out. *J. Public Econ.*, Oct. 1986, 31(1), pp. 79-104. University of Kansas, Lawrence.

**Findlay, Christopher C.—Optimal Taxation of International Income Flows**

The questions asked are whether double taxation is appropriate and whether cooperation is required to reach the optimal solution. Generally, some double taxation is desirable, as long as taxes are applied at the appropriate rates, and an efficient solution can be attained in the absence of explicit cooperation using a deduction rule, instead of the now commonly used credit rule. A rationale for the current system of tax agreements and their emphasis of the credit rule is discussed. *Econ. Rec.*, June 1986, 62(177), pp. 208-14. University of Adelaide, Australia.

**Fourgeaud, C.; Lenclud, B. and Picard, P.—Shadow Prices and Public Policies in a Disequilibrium Model of an Open Economy**

The paper focuses on the interaction between the goals of optimal stabilization and of allocative efficiency in project evaluation, in an economy that is small as an exporter, which must maintain trade balance, and where some disequilibrium may prevail on goods and labor markets. The criteria that are developed reflect an aggregation of profitability and reduction of unemployment. Additional foreign demand, foreign currency savings should be evaluated in welfare terms after weighting by the gap between the relevant market and shadow prices. The shadow prices also lead to the definition of an optimal taxation system. *Europ. Econ. Rev.*, Oct. 1986, 30(5), pp. 991-1012. University of Paris-I and CEPREMAP; University of Paris-I; University of Rouen and CEPREMAP.

**Hammond, Peter J.—Project Evaluation by Potential Tax Reform**

Shadow prices are derived for small open economies with several production sectors experiencing constant returns to scale. Small projects affect the balance of trade, domestic prices (of nontraded goods and factors), and sector scales. Only domestic prices affect welfare, and only if there is not "domestic price equalization." Generally, a project's net benefits depend upon the potential tax (and tariff) reform made possible (or necessary) through the balance-of-trade effect. Border prices are right for traded goods, but domestic good shadow pricing requires knowing the direction of at least one reversible available tax reform, and presuming optimality with respect to available reforms. *J. Public Econ.*, June 1986, 30(1), pp. 1-36. Stanford University.

Heady, Christopher J. and Mitra, Pradeep K.—Optimal Taxation and Public Production in an Open Dual Economy

The paper derives rules for organizing public production, setting taxes and offsetting labor market distortions in an open dual economy. Production efficiency is shown to obtain for the taxable part of the economy, a generalized Ramsey rule derived for producing-cum-consuming households in the directly nontaxable sector and new characterizations of optimal rural-urban migration established in the presence of distortionary taxation. A simple general equilibrium model is then numerically implemented and used to test the sensitivity of the analytically derived optimal policies to alternative assumptions about government revenue requirements, tax restrictions, the nature of property rights, and technological substitution possibilities. *J. Public Econ.*, Aug. 1986, 30(3), pp. 293-316. University College, London; World Bank.

Hellwig, Martin F.—The Optimal Linear Income Tax Revisited

The paper shows that the Mirrlees-Seade conditions of agent monotonicity and noninferiority of leisure imply the positivity of the optimal marginal income tax rate in Sheshinski's model of linear income taxation as well as in the general model. The optimal marginal tax rate is bounded above by the Rawlsian rate, which in turn is bounded by the revenue-maximizing rate. The optimal marginal tax rate may

be arbitrarily close to the Rawlsian rate. However, the optimal marginal tax rate is bounded away from the revenue-maximizing rate whenever the individual with the lowest ability works. *J. Public Econ.*, Nov. 1986, 31(2), pp. 163-79. University of Bonn.

Kimbrough, Kent P.—The Optimum Quantity of Money Rule in the Theory of Public Finance

This paper examines optimal tax policy in a monetary economy in which money serves as an intermediate good that helps facilitate the conversion of scarce resources into final consumption goods by enabling consumers to economize on the costs of transacting. It is shown that in such an environment, even though distorting taxes must be levied for revenue purposes, the optimal tax structure calls for abstaining from inflationary finance and adopting the optimum quantity of money rule. *J. Monet. Econ.*, Nov. 1986, 18(3), pp. 277-84. Duke University.

King, Mervyn A.—A Pigovian Rule for the Optimum Provision of Public Goods

The integrated treatment of optimal taxation and public expenditure presented here is based on the dual relationship between the prices of private goods and the quantities of public goods. The conditions for optimum public good provision can be expressed as a modification of the Samuelson conditions with extra terms representing: (1) the distortionary effect of taxes on the willingness to pay for the public good and (2) distributional effects. The former captures A. C. Pigou's notion of the indirect damage caused by the need to finance public expenditure out of distortionary taxes, and the author calls this the "Pigou term." In certain cases, a very simple benefit-cost ratio for public projects emerges that is equivalent to measuring benefits as if they were taxed. *J. Public Econ.*, Aug. 1986, 30(3), pp. 273-91. London School of Economics.

Laffont, Jean-Jacques and Tirole, Jean—Une Théorie Normative des Contrats État-entreprises (A Normative Theory of State-Firms Contracts).

The authors develop progressively models enabling us to characterize optimal contracts between government and firms when uncertainty and various types of asymmetric information (moral hazard and adverse selection) are present. Normative contracts, with a linear sharing of overruns, are obtained. *Ann. Econ. Statist.*, Jan.-Mar. 1986, (1), pp. 107-32 (French). GREMAQ, University of Social Sciences of Toulouse; Massachusetts Institute of Technology.

Logan, Robert R.—Fiscal Illusion and the Grantor Government

Empirical studies indicate that unconditional intergovernmental grants have a flypaper effect. Several authors have modeled recipient government spending under the fiscal illusion to explain this phenomenon. In short, grants reduce the perceived marginal cost of recipient government output. This paper develops a more general model of illusion that incorporates the grantor government, thereby eliminating inconsistencies encountered in previous models. The more general model implies that grant finance increases the perceived marginal cost of grantor government output. Thus grant-induced illusion should have two effects: an increase in recipient output and a decrease in grantor output. The empirical work supports this hypothesis. *J. Polit. Econ.*, Dec. 1986, 94(6), pp. 1304-18. University of Alaska, Fairbanks and University of Iowa.

Mookherjee, Dilip—Shadow Pricing with Sub-optimal Policy Rules

This paper aims to clarify different views on the validity of the Little-Mirrlees border price rule for project evaluation in a context where the government chooses its controls suboptimally in a systematic fashion. The rule is shown to be valid quite generally for small public sector projects when the government's response restores market-clearing in nontradeables and foreign exchange. It can be invalid in contexts of: (1) nonmarket clearing or (2) private sector projects that generate profits distributed to households. In the latter case, special treatment of profit effects is required along the lines suggested by I. Little and J. Mirrlees. *J. Public Econ.*, Dec. 1986, 31(3), pp. 287-306. Stanford University.

Moulin, Hervé—Characterizations of the Pivotal Mechanism

The pivotal mechanism is strategy proof (demand revealing) in public decision problems where preferences are quasi-linear. Moreover, no agent has an incentive to "free ride" by withdrawing from the committee and consuming whatever decision is taken by the remaining agents. Strategyproofness plus "no free ride" characterize the pivotal mechanism. This mechanism is anonymous and neutral. Yet together strategyproofness, anonymity and neutrality do not characterize it. They will, however, if reasonable lower (or upper) bounds on final utilities are imposed. The last characterization of the pivotal mechanism uses the "no free ride" axiom and two mild monotonicity properties, but not strategyproofness. *J. Public Econ.*, Oct. 1986, 31(1), pp. 53-78. Virginia Polytechnic Institute and State University.

Svensson, Lars-Gunnar and Weibull, Jörgen W.—An Upper Bound on Optimal Income Taxes

This paper identifies a range of tax rates that can be disregarded in linear optimal taxation approaches before any interpersonal utility comparisons are made. In particular, no tax rate above a certain level  $\beta < 1$  can be optimal with respect to Pareto-inclusive social orderings. It is shown that  $\beta$  is in general not larger than, and sometimes strictly less than, the minimal tax rate that maximizes tax revenues. Conditions under which  $\beta$  is the least upper bound are given, and a comparison is made with tax rates obtained by the Rawlsian maximin principle. *J. Public Econ.*, July 1986, 30(2), pp. 165-81. Lund University, Sweden; Institute for International Economic Studies, Stockholm University.

Tesfatsion, Leigh—Time Inconsistency of Benevolent Government Economies

A dynamic Walrasian economy is said to exhibit inconsistency if the competitive equilibrium path resulting from government reoptimization at some time  $\tau > 0$  is not a continuation of the competitive equilibrium path resulting from the initial government optimization at time 0. Necessary and sufficient conditions for consistency are established for a general class

of dynamic Walrasian benevolent government economies. Reliance on nondistortionary policy instruments is seen to be neither necessary nor sufficient for consistency. It is also shown that consistency is necessary but not sufficient for the support of a Pareto-optimal path as an optimal competitive equilibrium path. *J. Public Econ.*, Oct. 1986, 31(1), pp. 25-52. University of Southern California.

**Throsby, C. D. and Withers, Glenn A.—Strategic Bias and Demand for Public Goods: Theory and an Application to the Arts**

This paper provides systematic definition of free-rider and other biases in eliciting demand for public goods. It also demonstrates practicable techniques for allowing for these effects via survey method. In an application to the case of valuing social benefits from the arts, the extent of the biases is calibrated. This enables corrected estimates of public good benefit to be reported for the arts. An especially interesting finding is that free-rider behavior is random with respect to observable individual characteristics. *J. Public Econ.*, Dec. 1986, 31(3), pp. 407-27. Macquarie University, North Ryde, Australia; La Trobe University, Bundoora, Australia.

**Uomala, Matti—On the Optimal Taxation and Educational Decisions**

The author considers three different ways of incorporating individuals' educational choices into the design of optimal income tax policy. In one variant of the model it is shown that the marginal tax rate is generally not zero at the endpoints of distribution, but is most likely negative. Using numerical methods it is shown that the marginal tax rate is nondecreasing in income for a substantial income range. In addition, the calculations support neither the traditional views on the egalitarian nature of equal education nor its disadvantageous consequences in the perfect utilitarian society. *J. Public Econ.*, July 1986, 30(2), pp. 183-98. University of Helsinki.

**Yaher, Dan—Tax Evasion and the Marginal Cost of Public Funds**

Tax evasion and deadweight loss have similar consequences for the rules of public finance.

The optimal mix of taxes can be derived from the minimization of the sum of aggregate deadweight loss and aggregate cost of tax evasion. Similarly, the marginal cost of public funds includes allowances for marginal deadweight loss and marginal cost of tax evasion per dollar of public revenue acquired. *Econ. Inquiry*, Oct. 1986, 24(4), pp. 563-86. Queens University.

**Weymark, John A.—A Reduced-Form Optimal Nonlinear Income Tax Problem**

For a finite population with quasilinear preferences, it is shown how Mirrlees' optimal nonlinear income tax problem can be simplified to a reduced-form problem involving only the allocation of the consumption good. This result is a finite version of a proposition established in the continuum by S. Lollivier and J.-C. Rochet. *J. Public Econ.*, July 1986, 30(2), pp. 199-217. University of British Columbia and Northwestern University.

**Zodrow, George R.—Implementing Tax Reform: The Intergenerational Carryover Problem**

The implementation of tax reform may cause a "carryover problem" when previously taxed income is taxed again under the new tax regime; for example, the imposition of a cash flow consumption tax would double tax withdrawn savings originally financed with after-tax dollars. This paper analyzes the optimal implementation of a reform that causes such an "intergenerational" carryover problem and demonstrates that phasing-in is likely to be the optimal reform implementation policy. This result contrasts sharply with the case where the major problem induced by reform is arbitrary changes in asset prices, where phasing-in is generally of no benefit. *Nat. Tax J.*, Dec. 1986, 39(4), pp. 419-33. U.S. Treasury Office of Tax Analysis and Rice University.

**322 National Government Expenditures and Budgeting**

**Morrison, Rodney J.—Fiscal Marksmanship in the United States: 1950-83**

In this paper Theil's inequality coefficient is used to measure the accuracy of estimates of outlays, receipts, and deficits and surpluses in federal budgets in the United States for the

period 1950-83. In addition to evaluating overall fiscal marksmanship, actual forecast errors are partitioned into their three components: bias, variance, and randomness. The results obtained indicate that long-term forecasts were not very reliable signals of federal fiscal activity and that nonrandom sources accounted for at least 25 percent of the forecast error in 40 percent of the cases studied. *Manchester Sch. Econ. Soc. Stud.*, Sept. 1986, 54(3), pp. 322-33. Wellesley College.

### 323 National Taxation, Revenue, and Subsidies

Bacconche, Rafiq and Laisney, François—Analyse microéconomique de la réforme de la TVA de juillet 1982 en France (Microeconomic Analysis of the French VAT Reform of July 1982)

The effects of the reform on the welfare of households are analyzed with the INSEE survey "Budgets des familles 1979," using the methodology of M. A. King (1983) applied to a linear expenditure system where all parameters vary with household characteristics. The evaluation of global consequences of the reform uses indices of vertical inequality and horizontal inequity. The study indicates a slight redistributive effect. Most households benefit from the reform, but households with children are particularly advantaged. *Ann. Econ. Statist.*, Apr./June 1986, (2), pp. 37-74 (French). GREMAQ, University of Social Sciences, Toulouse.

### Barro, Robert J. and Sahasakul, Chaipat—Average Marginal Tax Rates from Social Security and the Individual Income Tax

The authors extend previous estimates of the average marginal tax rate from the federal individual income tax to include social security. The computations consider the tax rates on employers, employees, and the self-employed; the income that accrues to persons with earnings below the ceiling; and the effective deductibility of employers' social security contributions from workers' taxable income. The net effect of social security on the average marginal tax rate is below .02 until 1966, but then rises to .03 in 1968, .04 in 1973, .05 in 1974, .06 in 1979, and .07 in 1982. *J. Bus.*, Pt. 1, Oct. 1986, 59(4), pp. 555-66. University of Rochester; Rutgers University.

### Bovenberg, Arij Lans—Capital Income Taxation in Growing Open Economies

This paper studies how alternative capital mobility assumptions affect the incidence and efficiency of capital income taxation. It uses two-country intertemporal equilibrium model in which imperfectly elastic investment captures the notion of imperfectly mobile physical capital. If home goods and foreign goods are perfect substitutes and investment is relatively inelastic, tax effects in open and closed economies are similar. Only if physical capital is perfectly mobile are capital income taxes completely shifted in small open economies. Only then, and if significant terms of trade effects are absent, do open economy efficiency losses substantially exceed closed economy losses. *J. Public Econ.*, Dec. 1986, 31(3), pp. 347-76. International Monetary Fund.

### Fullerton, Don and Lyon, Andrew B.—Uncertain Parameter Values and the Choice among Policy Options

The authors use a tax policy example to show how debate on the value of an elasticity parameter translates into a debate about policy choices. To construct this example, suppose that the choice among four particular tax reform options is based on a single measure of efficiency gain. For each reform, it is shown how the size of this gain depends upon the elasticity of saving with respect to the net rate of return. Moreover, within quite narrow and reasonable bounds for the elasticity parameter, the authors find regions in which each of three different tax reforms turns out to dominate the others. *J. Public Econ.*, June 1986, 30(1), pp. 109-16. U.S. Treasury Department; U.S. Congress.

### Pressman, Steven—A Tale of Two Taxpayers: The Effects of the Economic Recovery and Tax Act of 1981.

Although ERTA gave wealthy taxpayers the largest reductions in marginal tax rates, effective tax rates have fallen more for middle class taxpayers. This paper examines the reasons for this phenomenon. Most importantly, lower marginal rates reduced charitable contributions and borrowing by wealthy taxpayers. This reduced their itemized deductions and increased their taxes. For middle class taxpayers, more

liberal adjustments to income lowered effective tax rates. Contrary to the claims of supply-side economists, there were no discernible income effects from the 1981 tax cut. *J. Post Keynesian Econ.*, Winter 1986-87, 9(2), pp. 228-36. Monmouth College, West Long Branch, New Jersey.

**Sahasakul, Chaipat**—The U.S. Evidence on Optimal Taxation over Time

This paper considers a tax rule in which a uniform tax rate over time becomes optimal. Its implications are that: (1) changes in the tax rate should arise only when there are changes in permanent government expenditures and (2) no variable other than permanent government expenditures should be of any value in predicting the tax rate. These implications are tested, using U.S. data for 1937-82. Empirical results of the tests reveal that, in addition to responding to permanent government expenditures, the tax rate also responds to temporary defense purchases, the general price level, and a time trend. *J. Monet. Econ.*, Nov. 1986, 18(3), pp. 251-75. Rutgers University, Newark, New Jersey.

**Warren, Alvin C., Jr.**—The Timing of Taxes

This paper considers the conditions under which the deferral or acceleration of a tax will not affect its present value. Expenditure and wage taxation, estate and gift taxation, dividend taxation, income taxation of deferred compensation, and income taxation of insurance companies are examined to draw some general conclusions about the significance of their common attributes for tax policy analysis. *Nat. Tax J.*, Dec. 1986, 39(4), pp. 499-505. Harvard University.

**324 State and Local Government Finance**

**Benker, Karen M.**—Tax Expenditure Reporting: Closing the Loophole in State Budget Oversight

In recent years, states have developed and improved budget oversight tools to strengthen control over public expenditures. However, despite these efforts, there is an area of the budget that routinely escapes rigorous inspection. This is the large allocation of state resources through

the use of tax expenditures, which reduce the taxes which might otherwise be collected. The federal government and seventeen state governments have begun the process of conducting an inventory and cataloguing all deviations from the normal tax code. These tax expenditure reports supplement the annual or biennial budget document. This article examines the major features of tax expenditure reporting at the state level. *Nat. Tax J.*, Dec. 1986, 39(4), pp. 403-17. National Association of State Budget Officers.

**Follain, James R. and Miyake, Tamar Emi**—Land versus Capital Value Taxation: A General Equilibrium Analysis

This paper analyzes via a computable general equilibrium model the effects of a reduction of the Jamaican income tax in favor of either a land value tax or a capital value tax. Important conclusions include: (1) There is less revenue potential from an LVT than from a CVT; (2) the welfare gains from the LVT are sensitive to the type of economy; and (3) the declines in deadweight loss that result from a switch to a CVT are modest, and it is possible that deadweight loss increases. This analysis also examines the effects of such a switch upon resource allocation and income distribution. *Nat. Tax J.*, Dec. 1986, 39(4), pp. 451-70. University of Illinois; New York State Assembly.

**Gordon, Roger H. and Wilson, John Douglas**—An Examination of Multijurisdictional Corporate Income Taxation under Formula Apportionment

This paper examines how corporate taxation of multijurisdictional firms using formula apportionment affects the incentives facing individual firms and states. Formula apportionment creates factor price distortions that vary across firms within a state in a way that gives a competitive advantage to multistate firms. Incentives for cross-hauling of output are also created, with production in low tax rate states more profitably sold in high tax rate states, and conversely. Politically, formula apportionment is very unstable—states face an incentive to shift to another form of taxation. None of these problems exist when a corporate tax uses separate accounting. *Econometrics*, Nov. 1986, 54(6),

pp. 1357-73. University of Michigan; Indiana University.

**Hildred, William M. and Pinto, James V.—**  
**Passive Tax Expenditures: Estimates of**  
**States' Revenue Losses Attributable to Fed-**  
**eral Tax Expenditures**

States that tax personal income and link their definitions of taxable income and allowable deductions to the definitions in the federal tax code suffer significant revenue losses because of that linkage. This article presents estimates of the revenue lost by each state, and argues that these passive tax expenditures are undesirable because they are inefficient and because states do not control their own tax bases. *J. Econ. Issues*, Dec. 1986, 20(4), pp. 941-52. Central State University, Edmond, Oklahoma; Northern Arizona University.

**Mikesell, John L.—**Amnesties for State Tax  
 Evaders: The Nature of and Response to Recent Programs

Since 1981, twenty-five states have conducted or have authorized formal amnesties under which businesses and individuals could pay prior tax liabilities without the penalties normally associated with tax evasion or nonobservance. Structural features of the programs have varied widely, however, as have the results in yields and impact on equity. This paper examines the structural components of each program and compiles yield data for the programs. Analysis shows that whether accounts receivable are eligible for amnesty is particularly important for yield. Revenue effects, long term as well as short term, and effects on fundamental equity and compliance incentives suggest that some amnesties may have been too broad, but that a number had made a clearly positive effect on tax administration and compliance. *Nat. Tax J.*, Dec. 1986, 39(4), pp. 507-25. Indiana University.

**Follock, Richard and Snyderboud, Jack P.—**  
**The Role of Rainy Day Funds in Achieving**  
**Fiscal Stability**

The discussion and design of fiscal stabilization at the state level has been hampered by the absence of an adequate framework to evaluate own-source revenue, expenditures, elasticities,

and cash balances in a longer-run, dynamic context. The lack of clear concepts and measures of fiscal stability is part of this lack of an appropriate framework. The potential for design failures of formula-based rainy day funds documents the danger of not having an adequate analytic paradigm. The authors develop a framework and an objective measure of fiscal stability that helps to fill this analytic gap. Simulations using these analytic tools indicate that formula-based rainy day funds can be destabilizing is not properly implemented. *Nat. Tax J.*, Dec. 1986, 39(4), pp. 485-97. University of Hawaii.

**325 Intergovernmental Financial Relationships**

**Hettich, Walter and Winer, Stanley—**Vertical  
 Imbalance in the Fiscal Systems of Federal  
 States

A theory of vertical fiscal imbalance in federal states (VFI) is developed that distinguishes between long-run and short-run imbalances and between normative and positive interpretations of the concept. The analysis is carried out in the context of a simple three-sector model where the allocation of national output among sectors results from interaction of a public choice process with an overall resource constraint. The paper proposes welfare-theoretic definitions of long-run and short-run VFI. In addition, it uses the concept as part of a positive analysis in order to reassess broad trends in Canadian fiscal history. *Can. J. Econ.*, Nov. 1986, 19(4), pp. 745-65. California State University; Carleton University, Ottawa.

**Hewitt, Daniel—**Fiscal Illusion from Grants  
 and the Level of State and Federal Expenditures

The theory of fiscal illusion maintains that local grant receipts will increase the demand for local public goods. This paper extends the fiscal illusion thesis to the federal and state levels. Federal or state grants to localities will increase the taxes levied by the donating agency without permitting an associated increase in direct services. If consumer/voters are largely unaware of intergovernmental transfers, grants will make the federal and state governments appear inefficient and thereby decrease demand for federal and state public goods. The hypothe-

sis is tested and confirmed by using survey data to estimate the impact of grants on the demand for state government expenditures. The fiscal illusion tendency is then used to explain observed shifts in the demand for defense expenditures. *Nat. Tax J.*, Dec. 1986, 39(4), pp. 471-83. University of Connecticut.

#### 400 International Economics

##### 410 INTERNATIONAL TRADE THEORY

##### 411 International Trade Theory

**Artus, Patrick**—Comment fonctionne le marché des exportations? (How Does The Export Market Operate?)

In this paper, several models (perfect or imperfect competition, flexible or fix-price models) for the determination of the level and the price of exports of manufactured goods are developed and estimated. A special interest is given to the link between the situation (price level and level of demand) on the domestic market, the volume and price of exports, and the degree of flexibility of prices. *Ann. Econ. Statist.*, Apr./June 1986, (2), pp. 3-36 (French). Bank of France.

**Bowden, Roger J.**—An Empirical Model of Bilateral Trade (or Its Absence) in Manufactured Commodities

Trade theories such as factor proportions, Linder, product cycle or gravity explanations are integrated into a compound structural representation, yielding a statistical nesting in which the contributions of different theories can be assessed and tested. Trade flows are disaggregated by origin, destination, and commodity. Censoring elements in the model predict whether or not trade will take place as well as the magnitude of observed trade flows. The method of estimation is maximum likelihood. The results strongly support gravity, partially support elements of factor proportions and Linder, and suggest an interaction between product cycle and Linder explanations. *Manchester Sch. Econ. Soc. Stud.*, Sept. 1986, 54(3), pp. 255-82. University of Western Australia.

**Cassing, James**—A Note on the Welfare Cost of a Tariff

Although for a small country the imposition of a tariff lowers national income at world prices, the reduction may itself be larger or smaller in the short run than in the long run. This paper exploits a simple quasi-specific factors model in order to isolate the forces at work and to derive the conditions for contemporaneous national welfare to be higher or lower in the longer run. *Eastern Econ. J.*, Apr.-June 1986, 12(2), pp. 145-48. University of Pittsburgh.

**Chaudhuri, T. Datta and Khan, M. Ali**—Commercial Policy in an Asymmetric World Economy

The authors present a two-country model of international trade and foreign investment with asymmetry in the sense that one of the countries, North, is a capital-rich, resource-poor economy; whereas the other, South, is a resource-rich, labor-surplus economy. The model thus highlights production interdependence as well as dependence through trade. The authors analyze the effects of commercial policies and factor accumulation on the allocation of resources and distribution of income. *J. Econ. (Z. Nationalökon.)*, 1986, 46(2), pp. 143-61. University of Calcutta; University of Illinois.

**Dinopoulos, Elias and Wooton, Ian**—A North-South Model of International Justice

The present paper develops a model with the South producing only a composite good, utilizing technology imported from the North. The North produces both technology and the composite good. It is demonstrated that free trade is not "just" in the Rawlsian sense. Alternative trading schemes, which are designed to maximize the welfare of the South, are examined and the optimal Rawlsian transfer from North to South is calculated. *Can. J. Econ.*, Nov. 1986, 19(4), pp. 766-79. Michigan State University; University of Western Ontario.

**Dixit, Avinash K. and Grossman, Gene M.**—Targeted Export Promotion with Several Oligopolistic Industries

The authors study export promotion policies in situations where several oligopolistic industries compete for the services of a sector-specific factor of production. The partial equilibrium argument for strategic subsidies must be modified.

led to incorporate general equilibrium effects working through the factor market. It is found that these effects generally weaken the case for profit-sharing subsidies. In a benchmark case with symmetric exporting industries, fixed coefficients technologized and an inelastic supply of the specific factor, free trade is shown to be optimal. *J. Int. Econ.*, Nov. 1986, 21(3/4), pp. 233-49. Princeton University.

**Dixit, Avinash K. and Norman, Victor**—Gains from Trade without Lump-Sum Compensation

This paper examines the possibility of designing a free-trade equilibrium that is Pareto-superior to a given autarkic one, using  $r$  redistributive tools other than lump-sum transfers. It is shown that: (1) if the production frontier allows some nonzero transformation in a neighborhood of autarky, and (2) there is a commodity, pure or composite, for which no two consumers trade on opposite sides of the market, then taxes and subsidies on goods and factors suffice for the purpose. If uniform poll subsidies are available, then condition (2) is not needed. Such policies are compatible with incentive-compatibility constraints, while lump-sum transfers are not. *J. Int. Econ.*, Aug. 1986, 21(1/2), pp. 111-22. Princeton University; Norwegian School of Economics and Business Administration, Bergen, Norway.

**Felder, Joseph**—Protectionism, Domestic Monopoly, and the Levels of Domestic Production and Consumption

A comparative static analysis is made of a small open economy that adopts protectionist policies, including a ban on international trade in the protected commodity, a prohibition on imports only, a tariff on imports, and a quota on imports. Conditions are identified under which local production and sales decrease under protectionism. Every policy, except possibly autarky, subsidizes ownership of the local industry rather than production or sales, *per se*. This is especially true when the domestic industry consists of just one or a few firms since a monopoly can exploit more fully the profit potential of protection. *Quart. J. Bus. Econ.*, Autumn 1986, 23(4), pp. 77-100. Bradley University, Peoria, Illinois.

**Galor, Oded**—Global Dynamic Inefficiency in the Absence of International Policy Coordination: A North-South Case

This paper demonstrates that decentralized behavior, reflected in noncoordinated resource pricing and investment strategies, may lead to global dynamic inefficiency. It is shown that in a North-South world, capital accumulation in the North reduces the social cost associated with the presence of labor market imperfections of the Lewis type in the South; whereas, resource pricing in the South affects investment decisions in the North. Thus, international policy coordination is required for attaining global dynamic efficiency. *J. Int. Econ.*, Aug. 1986, 21(1/2), pp. 137-49. Brown University.

**Grinols, Earl L.**—Foreign Investment and Economic Growth: Characterization of a Second-Best Policy for Welfare Gains

This paper prescribes corrective taxes for immiserizing growth and customs union formation (growth through removal of trade barriers) when the home country and the rest of world are financially linked through foreign investment and ownership of assets. An always feasible policy, which generates Pareto welfare gains for home country residents (and union countries' residents) is found. With foreign ownership, the policy generally requires a specific profits tax in addition to the usual taxes on traded goods and factors. The policy does not harm residents in the rest of the world; growth is Pareto noninferior from the world point of view. *J. Int. Econ.*, Aug. 1986, 21(1/2), pp. 165-71. University of Illinois.

**Itoh, Motoshige and Kiyono, Kazuharu**—Welfare-enhancing Export Subsidies

This paper shows that export subsidies on marginal goods and those on nonmarginal goods have opposite welfare effects for the country imposing these subsidies, where marginal goods are the ones that would be exported by only a small amount or not at all under free trade, but whose export can be promoted considerably by export subsidies. The former enhances the imposing country's welfare, while the latter worsens it. The paper also throws light on related issues such as industrial targeting policy. *J. Polit. Econ.*, Feb. 1987, 95(1),

pp. 115-37. University of Tokyo; Gakushuin University, Tokyo.

**Jensen, Richard and Thursby, Marie C.**—A Strategic Approach to the Product Life Cycle

This paper analyzes the steady-state, open-loop Nash equilibrium of a game in which a Northern monopolist devotes resources to a new product development and a Southern planner diverts resources into reverse engineering to learn the technology to produce these. A steady state equilibrium technology gap exists, showing that a constant technology gap over time can be explained by optimal strategic behavior of decisionmakers in a product cycle model. Given resource costs, neither the Northern monopolist nor the Southern planner wants to alter the gap. Comparative steady state analysis is used to compare strategic versus non-strategic behavior. *J. Int. Econ.*, Nov. 1986, 21(3/4), pp. 269-84. Ohio State University.

**Kemp, Murray C. and Tawada, Makoto**—The World Production Frontier under Variable Returns to Scale

The authors consider the properties of the world production set under conditions of variable returns to scale, with some (but not all) factors internationally mobile. It is shown that, broadly speaking, the world production set has the same properties as the production set of a single closed economy. *J. Int. Econ.*, Nov. 1986, 21(3/4), pp. 251-68. University of New South Wales; Nagoya City University, Japan.

**Kemp, Murray C. and Wan, Henry Y., Jr.**—Gains from Trade with and without Lump-sum Compensation

It is shown by example that there are situations in which free trade is Pareto-beneficial if, and only if, compensation is effected by lump sum transfers and that there are situations in which free trade is Pareto-beneficial if, and only if, compensation is not lump sum. *J. Int. Econ.*, Aug. 1986, 21(1/2), pp. 99-110. University of New South Wales, Australia; Cornell University.

**Makwarung, Lynn**—International Trade in New and Used Machines

The paper applies Piero Sraffa's model of fixed capital to the analysis of international trade in machines. A small economy specialized in one final product can purchase machines of any age from a large economy at fixed prices. The appropriate choice of machine age and some implications for income distribution are examined under a variety of circumstances, including positive costs of transporting machines. The consequences of technological progress in the large country are also analyzed. *Cambridge J. Econ.*, Sept. 1986, 10(3), pp. 247-63. University College, Cardiff.

**Miyagiwa, Kaz F.**—A Reconsideration of the Welfare Economics of a Free-Trade Zone

This paper presents a model of a free-trade zone that incorporates the fact that such zones are often established by government subsidies designed to promote nontraditional exports. In this model the condition is derived under which the establishment of a free-trade zone can increase welfare regardless of the relative factor intensity of a zone-based industry. However, the relative factor intensity of a free-trade zone plays a crucial role in determining the change in welfare following economic growth and foreign investment. *J. Int. Econ.*, Nov. 1986, 21(3/4), pp. 337-50. The University of Dayton.

**Rodrik, Dani**—Tariffs, Subsidies, and Welfare with Endogenous Policy

It is a well established proposition of trade theory that in the absence of directly trade-related distortions or policy goals subsidies are superior to tariffs for achieving any economic or noneconomic objective. This paper shows that once the endogeneity of the distortion or noneconomic objective is allowed for, the welfare-ranking of various policies can be reversed. The particular model analyzed is one where the level of noneconomic objectives that have to be fulfilled itself depends on the policy tools considered to fulfill them. This arises from the public-good nature of tariffs compared to subsidies. *J. Int. Econ.*, Nov. 1986, 21(3/4), pp. 283-99. Harvard University.

**Staiger, Robert W.**—Measurement of the Factor Content of Foreign Trade with Traded Intermediate Goods

In a recent article, Elihanan Helpman (1984) develops readily testable bilateral restrictions in a model of international trade, which preserve the spirit of Heckscher-Ohlin trade theory. Important in any empirical exploration of the Heckscher-Ohlin model is the decision of whether to employ direct or direct-plus-indirect calculations in determining the factor content of trade. This paper extends Helpman's analysis to a world of freely traded intermediate goods, and shows that direct factor content calculations are the theoretically appropriate measure for use in evaluating these empirical implications of the Heckscher-Ohlin model. *J. Int. Econ.*, Nov. 1986, 21(3/4), pp. 361-68. Stanford University.

Stockman, Alan C. and Deltas, Harris—Asset Markets, Tariffs and Political Risk

A model with political risk and uncertainty about tariffs implies a relationship between consumption and tariffs that differs radically from the implication of models without asset markets or political risk. Given the probability distribution of tariffs, domestic consumption, and utility (*ex post*) are lower when there is a domestic tariff and no foreign tariff than where there is a foreign tariff and no domestic tariff. This conclusion would be reversed in the absence of asset markets. The results imply that observed relations between consumption and tariffs may differ from the usual predictions in both time series or cross sections. *J. Int. Econ.*, Nov. 1986, 21(3/4), pp. 199-213. University of Rochester; Vanderbilt University.

Turnovsky, Stephen J.—Optimal Tariffs in Consistent Conjectural Variations Equilibrium

This paper analyzes the determination of the optimal tariff under the assumption of Consistent Conjectural Variations (CCV). A general characterization of the CCV equilibrium is given. The author shows that: (1) there are, in general, a multiplicity of such equilibria, and (2) under certain restrictions, the Cournot equilibrium which is based on the assumption of no retaliation, can also be a CCV equilibrium. By contrast, free trade is never a CCV equilibrium. Finally, the CCV equilibrium is solved explicitly in a simple example. *J. Int. Econ.*, Nov. 1986, 21(3/4), pp. 301-12. University of

Illinois and National Bureau of Economic Research.

Wong, Kar-yiu—Are International Trade and Factor Mobility Substitutes?

This paper analyzes whether factor flows and commodity trade are substitutes or complements, i.e., whether increasing the level of one impacts adversely or favorably on the volume of the other. It derives, with the aid of a new general equilibrium framework of the world that allows possible differences in factor and endowments, the necessary and sufficient condition for substitutability and complementarity. The results are then further examined in two special cases. A survey of different concepts of substitutability are complementarity that have appeared in the literature is also given. *J. Int. Econ.*, Aug. 1986, 21(1/2), pp. 25-43. University of Washington, Seattle.

Wong, Kar-yiu—International Factor Movements, Repatriation and Welfare

This paper analyzes two different ways of allowing foreign capital inflow: introducing it into the domestic economy and introducing it into a duty-free zone. It shows how the ranking of the two policies depends on the production patterns in the duty-free zone and the rules of factor income repatriation. The result can be used to explain the discrepancy between the rankings of these policies in two recent papers. The analysis also shows how the way of repatriating factor income could affect the equilibrium of factor movement, the welfare of the factor owners, and the welfare of the countries concerned. *J. Int. Econ.*, Nov. 1986, 21(3/4), pp. 327-35. University of Washington, Seattle.

Wootton, Ian—Preferential Trading Agreements: An Investigation

A three-country general equilibrium model of international trade in an arbitrary number of goods is constructed and the welfare effects of the formation of a preferential trading club (e.g., customs union, free trade area) are analyzed. *J. Int. Econ.*, Aug. 1986, 21(1/2), pp. 81-97. University of Western Ontario, London, Ontario.

Yeh, Yeong-Her—The Maximum Revenue Tariff vs. Transfer Payments

This paper intends to show that when the home country imposes the maximum revenue tariff, it will decrease the welfare of the foreign country. However, if the foreign country offers a transfer payment to the home country in order to have the tariff removed, its welfare could decrease even more. *Eastern Econ. J.*, Apr.-June 1986, 12(2), pp. 142-44. University of Hawaii.

Young, Leslie—A Note on 'Sector Specific Capital, Interconnectedness in Production, and Welfare'

The author notes some errors in a recent paper by T. D. Chaudhuri and M. A. Khan on the effects of international investment in a labor-surplus country and identifies a mechanism whereby comparative static changes apparently harmful to the investing country can end up benefitting it. *Can. J. Econ.*, Nov. 1986, 19(4), pp. 678-84. University of Texas.

#### 420 TRADE RELATIONS; COMMERCIAL POLICY; INTERNATIONAL ECONOMIC INTEGRATION

##### 421 Trade Relations

Bailey, Martin J.; Tavas, George S. and Ulan, Michael—Exchange-Rate Variability and Trade Performance: Evidence for the Big Seven Industrial Countries

This study presents results on the linkage between exchange-rate variability and exports of the Big Seven. Unlike previous work, the authors consider the demand of oil-producing nations given by their real export earnings and measure foreign income at both "high" and "low" dollar exchange-rate levels in order to exclude a bias by a specific exchange rate. Finally, a test is performed for the effects of instantaneous and delayed impacts of exchange-rate variability on exports. In sum, exchange-rate variability has not adversely affected exports of any of the Big Seven Countries over the flexible-rate period. *Weltwirtschaft. Arch.*, 1986, 123(3), pp. 466-77. U.S. State Department; International Monetary Fund; U.S. State Department.

Dana, Lawrence R.—The Excess Supply—Pure Demand Approach to International Commodity Trade: The Case of Japanese Steel Exports to the United States

The purpose of this paper is twofold: (1) to develop a theoretical framework for the analysis of export supply that is empirically more fruitful than existing approaches and (2) to present an empirical application of the theory to the market for Japanese steel, thereby quantifying important export supply elasticities not dealt with in the past. Evidence is presented that indicates that the supply of Japanese steel exports to the United States is price elastic and sensitive to Japanese and rest of world demand conditions. *Econ. Inquiry*, Oct. 1986, 24(4), pp. 645-56. John Carroll University.

Doroodian, Khosrow—The Permanent Income Theory of Demand for Imports of Finished Manufactured Goods: The Case of the United States.

Studies in international trade have suffered from a lack of empirical testing of the validity of permanent income hypothesis. This study attempts to fill the gap by developing an import demand function that includes transitory and permanent income as explanatory variables. The results are compared with those obtained from a traditional model. The statistical findings support the permanent income hypothesis as much as they support the current income hypothesis. Thus, the policy implications based on the latter hypothesis do not seem to be called into question when the former hypothesis is substituted for the current income hypothesis. *Quart. J. Bus. Econ.*, Winter 1987, 26(1), pp. 78-85. Ohio University.

Gahlen, Barnhard; Rahmeyer, Fritz and Standler, Manfred—Zur internationalen Wettbewerbsfähigkeit der deutschen Wirtschaft. (The International Competitiveness of the German Economy)

Deficits in the balance of current account between 1979 and 1981 induced a lively discussion about the competitiveness of the German economy. In this paper the authors discuss some recent research on international competitiveness and examine the usefulness of the commonly used indicators as there are current account balances, world market shares, real exchange rates, the adjustment of the economic structure to changing supply and demand conditions as well as technology indicators like

to real shocks. Regressions, consistent with the hypothesis that current exchange rate changes create immediate PPP deviations that are slowly dissipated but not eliminated, imply that both stick prices and real shocks are responsible for the recent failure of PPP. *J. Int. Econ.*, Nov. 1986, 21(3/4), pp. 313-26. State University of New York at Albany.

**Dow, Sheila C.—Post Keynesian Monetary Theory for an Open Economy**

Monetary theory of the balance of payments has become synonymous with global monetarism by default. This paper puts forward an alternative monetary theory of the balance of payments, which extends to the open economy Keynes's theory of liquidity preference and subsequent work in the Keynesian tradition on the endogeneity of the money supply process. The theory is expressed in the context of business cycle analysis. Openness is shown to increase the scope for financial instability. This result contrasts with the orthodox view that openness may increase the incidence of cycles, but nevertheless reduces their amplitude. *J. Post Keynesian Econ.*, Winter 1986-87, 9(2), pp. 237-57. Stirling University, Scotland.

**Evans, Paul—Is the Dollar High Because of Large Budget Deficits?**

It is widely believed that the U.S. dollar has been high in recent years because of large U.S. budget deficits. Using three statistical techniques, this paper shows that the belief has no empirical support. Ricardian equivalence may explain the lack of a positive association between the budget deficit and the dollar's exchange rate. *J. Monet. Econ.*, Nov. 1986, 18(3), pp. 227-49. University of Houston.

**Flood, Robert P. and Hedrick, Robert J.—Real Aspects of Exchange Rate Regime Choice with Collapsing Fixed Rates**

Typical evaluations of the choice of exchange-rate regime examine the performance of the real economy and assume that the regimes last indefinitely. In contrast, actual regimes are quite transitory. This paper examines how the predictions of two popular models for the determination of some real economic variables must

be modified when agents rationally perceive that a fixed-rate regime will be transitory. The models studied are simple stochastic versions of the models in Rudiger Dornbusch (1976) and Robert P. Flood and Nancy P. Marion (1982). *J. Int. Econ.*, Nov. 1986, 21(3/4), pp. 215-32. Northwestern University and National Bureau of Economic Research.

**Hogan, Lindsay I.—A Comparison of Alternative Exchange Rate Forecasting Models**

this paper compares structural and times-series models on the basis of their accuracy in forecasting the Australian-U.S. dollar exchange rate. Purchasing power parity, forward exchange theory, static and dynamic specifications of both the flexible-price and sticky-price monetary models, and univariate ARIMA models are considered. Forecasts are generated at horizons of one to four quarters. In contrast to overseas results, several models in this study are found to generate forecasts superior to the random walk model. *Econ. Rec.*, June 1986, 62(177), pp. 215-23. Bureau of Agricultural Economics, Canberra.

**Honohan, Patrick and Peruga, Rodrigo—Exchange Rates Do Not Fail Variance Bounds Tests**

Market efficiency and rational expectations place theoretical bounds on the volatility of exchange rates in the context of the monetary approach to exchange rate determination. It is shown that, when account is taken of the sluggishness of domestic prices, these bounds are satisfied by actual exchange-rate movements. *Manchester Sch. Econ. Soc. Stud.*, Sept. 1986, 54(3), pp. 308-13. Office of the Taoiseach, Dublin, Ireland; University of California, San Diego.

**Kearney, Colm and MacDonald, Ronald—A Structural Portfolio Balance Model of the Sterling-Dollar Exchange Rate**

In this paper a version of the portfolio-balance approach to the determination of the exchange rate is implemented structurally for the sterling-dollar exchange rate over the period 1973-82. The model is implemented using the Brainard-Tobin methodology, which ensures that the necessary adding-up restrictions are

satisfied. Both Ordinary Least Squares and the Theil-Goldberger mixed estimation procedure are used to estimate the model. A variety of asset shock simulations are conducted, and the response of interest rates and the exchange rate to such shocks is illustrated. *Weltwirtschaft. Arch.*, 1986, 122(3), pp. 478-96. University of New South Wales; University of Aberdeen.

**Kiguel, Miguel A.**—Macroeconomic Adjustment under a Sliding Peg Exchange Rate and Imperfect Capital Mobility

This paper introduces a model of a small open economy under a sliding peg exchange-rate rule, imperfect capital mobility, and rational expectations. It is shown that a reduction in the rate of crawl leads to an appreciation of the real exchange rate, a current account deficit, and capital inflows. When capital is highly mobile internationally, there might even be initially an increase in the rate of inflation. Contrary to what has become common knowledge, large capital flows do not create instability. The paper also emphasizes the need to coordinate the exchange-rate rule with the budget deficit. *Eastern Econ. J.*, July-Sept. 1986, 12(3), pp. 297-306. University of Maryland.

**Laskar, Daniel**—International Cooperation and Exchange Rate Stabilization

The author shows that exchange rate stabilization can be viewed as a public good. Consequently, when countries do not coordinate their economic policies, the exchange rate fluctuates more than in the case of international cooperation. A quite standard two-country model where the policymakers of each country have at their disposal one policy instrument, the money stock, and want to reduce the fluctuations of both the domestic output and the domestic price level is considered. Then, the non-cooperative Nash equilibrium is compared to the set of Pareto optima. The analysis provides a formal argument for some exchange-rate stabilization. *J. Int. Econ.*, Aug. 1986, 21(1/2), pp. 151-64. CNRS-CEPREMAP, Paris.

**Sauernheimer, Karlhans**—Tariffs, Imported Inputs and Employment

This paper examines the effects of an import tariff on employment under flexible exchange

rates, stressing the role of factor markets. In the model consumers choose between the domestically produced good and a foreign tariff-charged good; producers choose between domestic labor and a foreign intermediate good as factors of production. In most cases the protective trade policy results in lower employment. *Economica*, Aug. 1986, 53(211), pp. 393-99. University of Essen, West Germany.

**433 Private International Lending**

**Callier, Philippe**—"Professional Trading," Exchange Rate Risk and the Growth of International Banking: A Note

By establishing money market and foreign exchange operations in major trading centers throughout the world, large banks can reduce the risk of these operations: round the clock dealing reduces the variance of speculative profits generated by foreign exchange trading. Because the availability of speculative funds is essential to promote capital mobility through the activity of interest arbitrageurs, this reduction of the risk inherent to currency speculation by professional traders is presented as a positive development. *Banca Naz. Lavoro Quart. Rev.*, Dec. 1986, (159), pp. 423-28. Concordia University, Montreal.

**440 INTERNATIONAL INVESTMENT AND FOREIGN AID**

**441 International Investment and Long-term Capital Movements**

**Das, Satya P.**—Optimal Taxation of Foreign Capital When Its Movements Are Sluggish

This paper examines optimal taxation of foreign capital by a host country when its movements are sluggish. It is shown that as long as the host country discounts future welfare, it is optimal to tax foreign capital even when it is small enough to be unable to influence the reward to capital in the source country. This is because the initial gain from taxing foreign capital constitutes a rent transfer from foreign capital owners to the host country, which outweighs the future losses in terms of reduced output. *J. Int. Econ.*, Nov. 1986, 21(3/4), pp. 351-60. University of Wisconsin-Milwaukee.

**Kaempfer, William H. and Lowenberg, Anton D.**—A Model of the Political Economy of In-

**International Investment Sanctions: The Case of South Africa**

This article examines the effects of disinvestment sanctions against South Africa on the survivability of the apartheid. An "interest group" model of the South African state is developed, in which apartheid policies are treated as endogenous outcomes of a political decision-making process. The effects of sanctions are introduced through the impact of international capital flows and asset prices on major interest groups within the white electorate. Circumstances under which disinvestment sanctions might raise the costs of apartheid to the South African state sufficiently to bring about a diminution of apartheid policies are examined. *Kyklos*, 1986, 39(3), pp. 377-96. University of Colorado; California State University, Northridge.

**Sieber, René and Wetterwald, Paul—Environmental Protection and Direct Foreign Investment with Specific Factors of Production: The Case of the Small Open Economy**

This paper provides an analysis of the effects of a stronger environmental protection on direct foreign investment flows within the context of a small open economy. Compared to previous studies, the two-sector model used is characterized by capital and pollution sector specificity. Depending on the technological structures and on the degrees of international capital mobility, a stronger policy in one sector can induce various patterns of investment flows. Precise conditions relative to the direction of these flows are derived. In particular, there is a possibility of cross-hauling, i.e., two-way capital flows. *Schweiz. Z. Volkswirtschaft. Statist.*, Dec. 1986, 122(4), pp. 611-25. University of Geneva.

**Takagi, Yasouki—Inflation and Cumulative Debt Outstanding of Less-Developed Countries**

A high rate of inflation and cumulative debt outstanding are serious economic problems for many LDCs. The purpose here is to attempt a theoretical explanation of the linkage between these phenomena and a dramatic change in the world economy since the first oil crisis. The paper discusses whether or not under the cur-

rent world economic situation a nonoil producing LDC can promote capital accumulation without accelerating inflation and cumulative debt outstanding. Also examined is the question of whether or not the effects on inflation and capital formation are different between the cases of temporary and permanent changes in oil price. *J. Int. Econ.*, Aug. 1986, 21(1/2), pp. 61-80. Doshisha University, Karasuma, Kyoto, Japan.

**443 International Lending and Aid (Public)**

**Dietz, James L.—Debt and Development: The Future of Latin America**

This paper examines the necessary conditions for resolving the debt crisis in a manner consistent with economic growth. After considering the weight of internal and external causes of debt accumulation, the applicability of the East Asian model to Latin America is considered and reformulated such that the focus is on the institutional structures that impede or facilitate a process of dynamic adjustment to change rather than on model characteristics. The nature of the institutional evolution compatible with resolving the debt crisis along a nonausterity growth path of development also is examined. *J. Econ. Issues*, Dec. 1986, 20(4), pp. 1029-51. California State University, Fullerton.

**van Wijnbergen, Sweder J. G.—Macroeconomic Aspects of the Effectiveness of Foreign Aid: On the Two-Gap Model, Home Goods Disequilibrium and Real Exchange Rate Misalignment**

The author constructs an open-economy disequilibrium model to assess the welfare effects of aid in different macroeconomic regimes. Aid is shown to have different effects in different unemployment regimes because it increases the social costs of wage-price rigidities in the classical regime, but decreases them in the Keynesian unemployment regime. A link is made with the two-gap model, but the role of real exchange rate misalignment (failure to clear the NT goods market) is highlighted. Finally, simple formulas are given for the welfare effects of aid in different regimes that should help in empirical application. *J. Int. Econ.*, Aug. 1986, 21(1/2), pp. 123-36. World Bank and Centre for Economic Policy Research, London.

## 500 Administration; Business Finance; Marketing; Accounting

### 510 ADMINISTRATION

#### 512 Managerial Economics

Goldstein, Jonathan—Markup Variability and Flexibility: Theory and Empirical Evidence

This paper summarizes and empirically tests an alternative theory of markup pricing. It is concluded that, over the typical business cycle: (1) the markup rises from initial trough until the midexpansion and then declines until the terminal trough, and (2) markup flexibility is positively related to the degree of (demand) competition. This cyclical pattern of markup variability is shown to exist in major industry groups for all postwar cycles up to 1980. Regression analysis reveals that in highly concentrated industries a positive relation exists between markup flexibility and the level of import competition and a proxy for the elasticity of demand. *J. Bus.*, Pt. 1, Oct. 1986, 59(4), pp. 599-621. Bowdoin College.

Hodder, James E. and Ilan, Yael A.—Declining Prices and Optimality when Costs follow an Experience Curve

There is a widely held notion that as production costs decline with experience, prices should follow more or less in parallel. Although this notion has been an important factor in estimating experience curves and in formulating corporate strategies, the authors show that it is generally inconsistent with published multi-period optimal pricing models. The paper then goes on to demonstrate that this apparent conflict can be reconciled by allowing the demand process to exhibit increasing price elasticity over time. Since this demand characteristic is very plausible for innovative products, it is suggested that it be incorporated into optimal pricing models. *Managerial Dec. Econ.*, Dec. 1986, 7(4), pp. 229-34. Stanford University; Technion-Israel Institute of Technology.

Morgan, George Emir and Martin, John D.—A Rationale for Planning: Implications from the Economic Theory of the Firm

This paper undertakes the development of a foundation for a theory of why firms plan. The theory of the firm literature provides a useful

starting point and provides insight into the factors that have an effect on the planning function of the firm. Those factors include transactions costs, uncertainty, and asset specificity. The fact that some firms should not plan even in the face of uncertainty and transactions costs emphasizes the importance of the relative magnitudes of various costs, and demonstrates the relevance of standard economic analysis for the study and practice of business planning. Examples illustrate the role of planning for human, financial, and physical resources. *Managerial Dec. Econ.*, Dec. 1986, 7(4), pp. 219-28. Virginia Polytechnic Institute and State University; University of Texas.

#### 514 Goals and Objectives of Firms

Pantalone, Coleen and Welch, Jonathon B.—The Usefulness of Public Information about Corporate Goals

This paper investigates the relationship between corporate goals and stock price performance. In this study, firms are classified according to their stated financial goals. The risk-return market model is used to compare the performance of portfolios of companies that have different financial goals. Statistical tests reveal no significant difference in risk or return between the two portfolios. That is, stated corporate goals are fully incorporated. This supports the efficient market hypothesis concerning publicly available information on corporate goals. *Quart. J. Bus. Econ.*, Autumn 1986, 25(4), pp. 29-40. Northeastern University.

### 520 BUSINESS FINANCE AND INVESTMENT

#### 521 Business Finance

Miller, Merton H.—Behavioral Rationality in Finance: The Case of Dividends

Dividends seem a natural area in finance where the introduction of behavioral/cognitive elements might help resolve long-standing anomalies, particularly the seeming failure of supply to adjust to tax-induced price penalties. A closer look at the empirical record, however, particularly at evidence of responsiveness to major structural changes, shows behavior of the aggregates to be less anomalous than conventional hand-wringing might suggest. Behavioral/cognitive elements, whatever they might contribute to the description of particularly in-

crodecisions, do not appear essential adjuncts to the basic finance model in the major, comparative static applications for which it was intended. *J. Bus.*, Pt. 2, Oct. 1986, 59(4), pp. S451-66. University of Chicago.

**Richardson, Gordon; Sefcik, Stephan E. and Thompson, Rex**—A Test of Dividend Irrelevance Using Volume Reactions to a Change in Dividend Policy

The authors investigate the implication of clientele theories that changes in dividend policy should result in a marked increase in trading volume as shareholder clienteles change. With 192 firms announcing their first cash dividend, both an increase in trading volume and firm value around the announcement date are documented. These results are integrated to distinguish between the volume response to good news about the future and clientele adjustments to a change in dividend policy. The results suggest that volume increases primarily in response to the signal about future earnings contained in the dividend. Clientele adjustments are small. *J. Finan. Econ.*, Dec. 1986, 17(2), pp. 313-33. University of British Columbia; University of British Columbia; University of Pennsylvania.

**Shleifer, Andrei and Vishny, Robert W.**—Greenmail, White Knights, and Shareholders' Interest

This article develops a model in which greenmail and other forms of management resistance to takeovers can benefit shareholders. In particular, discouraging some potential acquirers may increase shareholder wealth because it encourages others to pursue a combination with the target. This occurs because the number of competing acquirers is reduced and because resistance can signal that the target does not have access to a "white knight." This signaling effect may explain why share prices decline after management resists a takeover, even when such resistance is value-maximizing in the long run. *Rand J. Econ.*, Autumn 1986, 17(3), pp. 293-309. Princeton University; University of Chicago.

**522 Business Investment**

**Sumner, M. T.**—Investment and the 1984 Budget: An Interim Assessment

The 1984 U.K. budget introduces a sequence of reductions in the corporate tax rate and the phasing out of first-year allowances for investment. When these reforms have been completed, in 1986-87, their effect will be to depress investment; but during the transition they create an incentive to bring planned investment forward, in order to write off a higher proportion of its cost against a higher tax rate than will prevail later. This paper analyzes the magnitude of the incentive to anticipate, and reports preliminary estimates of its impact during the first year of the transition. *Oxford Bull. Econ. Statist.*, Nov. 1986, 48(4), pp. 331-38. University of Sussex.

### 530 MARKETING

**531 Marketing and Advertising**

**Levedahl, J. William**—Profit Maximizing Pricing of Cents Off Coupons: Promotion or Price Discrimination?

A profit-maximizing model of the pricing of cents-off coupons is presented that includes the price discrimination and the promotional interpretation of coupons. The two interpretations are not incompatible. For brand-loyal customers who do not use coupons, however, the two effects influence price in the opposite direction. Panel data on branch purchases of paper towels are used to indicate the net magnitude of the two effects in this case. The results are consistent with the hypothesis that the price discrimination effect is stronger than the promotional effect in explaining the impact of couponing on full product price. *Quart. J. Bus. Econ.*, Autumn 1986, 25(4), pp. 56-70. North Carolina State University.

### 600 Industrial Organization; Technological Change; Industry Studies

#### 610 INDUSTRIAL ORGANIZATION AND PUBLIC POLICY

**611 Market Structure: Industrial Organization and Corporate Strategy**

**Adams, Walter and Brock, James W.**—Corporate Power and Economic Sabotage

In an advanced functionally interdependent society, organized power groups are able to disrupt the efficient functioning of the economic

system. If they persist in exercising their power, or if they must continually be bribed to refrain from doing so, they can (*in extremis*) cause the breakdown of the system. This hypothesis is explored with respect to U.S. regulatory policy, international trade policy, and macro stabilization policy. The article concludes that a structural antitrust policy is a prerequisite not only for maintaining competition, but for preventing economic extortion and social sabotage by giant power complexes. *J. Econ. Issues*, Dec. 1986, 20(4), pp. 919-40. Michigan State University; Miami University, Oxford, Ohio.

Beck, Roger L.—Structure and Performance with Profit Measures Based on Stock Market Prices

The belief that profit increases with concentration is tested using risk-adjusted profit measures based on stock market prices. A time-series analysis is chosen to gain freedom from the questionable assumption in cross-section studies that the concentration/profit relationship is homogeneous across industries, and to minimize the problem of omitted or inaccurately measured structural variables. The data are consistent with the hypothesis that there is no relationship between concentration and profits, contradicting both the efficiency and collusion explanations of cross-section results. This study is consistent with a belief in the importance of contestability in oligopolistic markets. *Southern Econ. J.*, Oct. 1986, 53(2), pp. 432-47. University of Alberta, Edmonton.

Brennan, Timothy J. and Kimmel, Sheldon—Joint Production and Monopoly Extension through Tying

The authors provide an exception to the general rule that a monopolist in one market cannot profitably monopolize other markets by tying. Depending upon demand and cost conditions, a monopoly distributor of one product jointly produced with a second (e.g., beef and leather) may increase profits by tying distribution of the first product to purchase of the second. The upstream tie enables this distributor to acquire downstream monopoly over the supply of the second product, but with ambiguous welfare effects. Upstream monopoly is not necessary to obtain this result. The theory is applied to

a number of actual cases. *Southern Econ. J.*, Oct. 1986, 53(2), pp. 490-501. U.S. Department of Justice.

Chen, K. C.; Cheng, David C. and Hite, Gailen L.—Systematic Risk and Market Power: An Application of Tobin's  $q$

The authors investigate the relationship between systematic risk and market power measured by Tobin's  $q$ , the ratio of market value to replacement cost. They demonstrate that there is a one-to-one relationship between the Tobin's  $q$  ratio and the Subrahmanyam and Thomadakis measure of market power. The theoretical model predicts that as a firm's market power increases, the systematic risk will, *ceteris paribus*, decrease. The empirical results ultimately confirm this negative association as predicted by M. G. Subrahmanyam and S. B. Thomadakis. *Quart. Rev. Econ. Bus.*, Autumn 1986, 26(3), pp. 58-72. University of Illinois; University of Alabama; Southern Methodist University.

Dixon, Robert and Gunther, Alan—Margins, Concentration and Oligopolistic Interdependence

The authors examine the relationship between margins, elasticities of demand, and the Hirschman-Herfindahl index of concentration for Australian manufacturing. The main aim is to estimate the degree of collusion in various manufacturing sectors in the years 1968-69, 1972-73, and 1977-78. There appear to be marked differences in the apparent degree of collusion between industries. It is argued that once suboptimization is allowed, the Cowling-Watson model will yield biased estimates of the degree of collusion. *Econ. Rec.*, June 1986, 62(177), pp. 199-207. University of Melbourne.

Domowitz, Ian; Hubbard, R. Glenn and Petersen, Bruce C.—Business Cycles and the Relationship between Concentration and Price-Cost Margins

Using a newly constructed panel data base, the authors examine changes in price-cost margins in 284 manufacturing industries between 1958 and 1981. A key finding is a dramatic narrowing of the spread between the margins of concentrated and unconcentrated industries

has emphasized Alcoa's control over the size of the secondary sector in the long run as a source of market power for Alcoa. The results here indicate that Alcoa could exert little influence in this regard, but nonetheless had substantial market power. *Rand J. Econ.*, Autumn 1986, 17(3), pp. 389-403. University of Michigan.

**612 Public Policy toward Monopoly and Competition**

**Smith, W. James and Vaughan, Michael B.**—Economic Welfare, Price and Profit: The Deterrent Effect of Alternative Antitrust Regimes

This paper critically examines the deterrent effect of price-fixing statutes under alternative antitrust regimes. A regime is defined by the litigation strategy that the antitrust agency employs in detecting cartels and in determining whether prosecution is warranted and by the basis upon which courts estimate damages. The results of the analysis suggest that antitrust policy may actually induce cartels to further restrict output, increasing welfare loss above the level imposed by an unthreatened, perfect monopoly. Litigation strategy and damages should be founded upon consideration of welfare loss measures to avoid this possibility. *Econ. Inquiry*, Oct. 1986, 24(4), pp. 615-29. Weber State College, Ogden, Utah.

**614 Public Enterprises**

**Boardman, Anthony; Freedman, Ruth and Eckel, Catherine**—The Price of Government Ownership: A Study of the Domtar Takeover

This paper presents an analysis of how government ownership of an enterprise may affect its profitability. In August 1981, two Quebec Crown Corporations announced that they had gained control of Domtar, a private Canadian corporation. Upon receipt of this information the stock's market value dropped significantly. Over six trading days, Domtar's shareholders suffered cumulative abnormal returns of minus 25 percent, which is equivalent to a reduction in market value of approximately \$150 million. Much of this loss can be attributed to government control and the anticipated pursuit of non-profit objectives. *J. Public Econ.*, Dec. 1986, 31(3), pp. 289-85. University of British Colum-

bia; Stanford University; Virginia Polytechnic Institute and State University.

**Domberger, Simon and Piggott, John**—Privatization Policies and Public Enterprise: A Survey

This paper surveys and analyzes the economic literature on "privatization" policies, restricting coverage to policies designed to improve the operating efficiency of public-sector enterprises through increased exposure to competitive market forces. Liberalization is an important ingredient in any policy package designed to improve the operating efficiency of public-sector enterprises. Asset sale may enhance the beneficial impact of deregulation, but asset sale in the absence of deregulation is unlikely to improve efficiency, and may introduce additional market distortions. Franchising is seen as an appropriate mechanism for privatization. *Econ. Rec.*, June 1986, 62(177), pp. 145-62. London Business School and University of Sydney; University of Sydney.

**Hartley, Peter and Trengove, Chris**—Who Benefits from Public Utilities?

The authors model the determination of output, factor payments, and prices within publicly owned firms, assuming the firms are managed by utility-maximizing employees monitored by vote-maximizing politicians. The choice of a public monopoly to supply the output is most suited to further the redistributive aims of the politicians, but will also be favored by employees who can capture some rents. *Econ. Rec.*, June 1986, 62(177), pp. 163-79. Monash University, Clayton, Australia and Princeton University; Monash University.

**Ware, Roger**—A Model of Public Enterprise with Entry

Recent advances in technology have called into question the status of many traditional "natural monopoly" industries, such as telecommunications, mail service, and some utilities. This paper examines market equilibria for these transitional market structures in cases where one of the firms involved is a public enterprise. If the efficient market structure is a duopoly, an incumbent public enterprise may be unable

to credibly induce entry, because of its commitment to maximizing total rather than private surplus. Several other propositions are demonstrated for mixed market equilibrium in natural monopoly/natural duopoly market structures. *Can. J. Econ.*, Nov. 1986, 19(4), pp. 642-55. Carleton University, Ottawa.

#### 615 Economics of Transportation

**Kim, Moshe and Sachish, Arie**—The Structure of Production, Technical Change and Productivity in a Port

The primary focus of this paper is the modeling and estimation of the structure of production, technical change, and total factor productivity (TFP) growth in a port. Special attention is given to the specification of technical change, which is measured as the percent of containerization. The findings indicate that technical change has been labor saving and capital using. TFP has been growing from 1966 to 1983 at an annual average rate of 0.11. The main contribution to TFP growth has been containerization. On the average, 85 percent of the growth in TFP has been due to containerization and 15 percent of the growth has been due to economies of scale and output growth. *J. Ind. Econ.*, Dec. 1986, 35(2), pp. 209-23. University of Haifa; Port of Ashdod, Israel.

**Sickles, Robert C.; Good, David, and Johnson, Richard L.**—Allocative Distortions and the Regulatory Transition of the U.S. Airline Industry.

This paper develops a model of allocative distortions with which the authors analyze departures of the U.S. airline industry from efficient resource allocation during the period 1970-81. Airline technology is assumed to transform capital, labor, energy, and materials into passenger and cargo service whose characteristics are endogeneously determined. A generalized-Leontief system of distorted profit, output supply, input demand, and reduced form output characteristics expressions is estimated by FIML using a multivariate error components model with vector autoregressive disturbances. The results tend to support the common perception that deregulation reduced both the total cost and relative level of allocative distortions. *J. Econometrics*, Oct./Nov. 1986, 33(1/2), pp.

143-63. Rice University; Indiana University; U.S. Department of Justice.

#### 619 Economics of Regulation

**Hayes, Beth and Siegel, Daniel**—Rate of Return Regulation with Price Flexibility

This paper considers a change in rate-of-return regulation that will dominate standard price setting. Rather than fixing the price that the regulated firm must charge, the regulator should allow the firm to charge any price less than or equal to a ceiling price. The authors demonstrate the advantages of this proposal and develop a methodology for determining fair regulatory ceilings. The methodology explicitly takes account of the effect of regulation on financial risk, and a technique for measuring the importance of this effect is developed. Finally, an example is introduced to demonstrate the techniques and to show the potential quantitative importance of the analysis. *J. Bus.*, Pt. 1, Oct. 1986, 59(4), pp. 537-53. Northwestern University.

**Varela, Oscar and Olson, Richard E.**—A General Equilibrium Analysis of Financial Regulation

This paper utilizes a general equilibrium approach to investigate factor returns and output effects on a regulated and unregulated sector from imposition of a rate of return on investment regulatory constraint. The results differ from those of the "traditional" partial equilibrium model of the regulated firm developed by Harvey Averch and Leland Johnson (AJ). The differences are explained by the fact that the general equilibrium approach assumes the existence of efficient capital markets, whereas the AJ approach does not. Introduction of the competitive capital market framework in the study of financial regulation through the general equilibrium methodology is this paper's major contribution. *J. Public Econ.*, Aug. 1986, 30(3), pp. 329-40. University of New Orleans; Washburn University of Topeka.

#### 620 ECONOMICS OF TECHNOLOGICAL CHANGE

**621 Technological Change, Innovation, Research and Development**

**Antle, John M.**—Aggregation, Expectations, and the Explanation of Technological Change

Production with technological change is defined in terms of the stationarity properties of the stochastic process generating output. The aggregation analysis shows that the structures of microeconomic and aggregate production models are different. The process generating aggregate output depends on the information firms use to form expectations; the process generating each firm's output does not. This poses a problem for analysis of technological change with aggregate data, because the variables used to explain technological change may be in the firm's information set. Thus it may not be possible, without imposing further restrictions on the process generating aggregate output, to identify the aggregate model and measure technological change. *J. Econometrics*, Oct./Nov. 1986, 33(1/2), pp. 213-36. University of California, Davis.

**Boseman, Barry; Link, Albert and Zardkoobi, Asghar**—An Economic Analysis of R&D Joint Ventures

A graphical model of cooperative R&D activity is presented, from which outcomes of R&D joint ventures are posited. The analysis predicts that R&D spending will increase as a result of cooperation and that the increment will tend to be in basic research more than applied or development. *Managerial Dec. Econ.*, Dec. 1986, 7(4), pp. 263-66. Syracuse University; University of North Carolina; Texas A&M University.

**Capitelli, René and Müller, Heinz H.**—Ein Beispiel zum Problem der Innovationsförderung (Stimulating Innovation Activities: An Illustration)

The innovation process under perfect patent protection has been analyzed by G. C. Loury (1979) and T. Lee and L. L. Wilde (1980). Here, the authors concentrate on an example stressing the polar case of no protection at all. Thus, they look at process innovations that become simultaneously available to all market participants. Due to the occurring externalities the following results are obtained: (1) decentralized market structures slow down innovations; (2) ignoring administrative costs, government actions might create incentives which bring back innovations to their social optimum; and (3) al-

lowing for administrative costs, a policy-induced stimulation of the innovation process may simultaneously increase total spending on innovation and reduce effective innovative activity. *Schweiz. Z. Volkswirtsch. Statist.*, Sept. 1986, 122(3), pp. 535-53 (German). Institut für angewandte Wirtschaftsforschung, University of Basel; Institut für empirische Wirtschaftsforschung, University of Zürich.

**Klette, Tor and de Meza, David**—Is the Market Biased against Risky R&D?

This article analyzes the riskiness of the R&D strategies chosen by firms engaged in a "winner-takes-all" patent race. In contradiction to P. Dasgupta and J. Stiglitz (1980), the authors show that, when the distribution of invention times is symmetric, the market equilibrium cannot be safer and may be riskier than is socially optimal. The economic reason for the emergence of this result is identified. With asymmetric distributions the market equilibrium may be excessively safe, but only if there are few competitors. *Rand J. Econ.*, Spring 1986, 17(1), pp. 133-39. London School of Economics.

**Nelson, Randy A.**—Capital Vintage, Time Trends, and Technical Change in the Electric Power Industry

This paper examines the effects of different technological proxies on the estimated rate and direction of technical change in the electric power industry. Multivariate specification tests are used to determine the appropriate function with which to model the cost function. Three alternative versions are estimated, employing a time trend, a vintage index, and both to represent the pace of innovation. The results support the use of the multiple index model, and indicate that the two proxies yield significantly different estimates of technical change, with the vintage estimates more closely conforming to *a priori* expectations regarding the direction of technical change. *Southern Econ. J.*, Oct. 1986, 53(2), pp. 315-32. University of Delaware, Newark.

**Schenkerman, Mark and Pakes, Ariel**—Estimates of the Value of Patent Rights in European Countries during the Post-1950 Period

This paper empirically analyzes the private value of patent rights in the United Kingdom, France, and Germany during the postwar period, using an economic model of patent renewal. Estimates of the distribution (and total value) of patent rights and its changes over time are obtained. Of particular empirical interest is the total value of patent rights and the relationship between changes in it and changes in the quantity of patents, technological exhaustion, and demand inducement as determinants of patent values, the skewness in the distribution of patent values, and the rate of obsolescence on the returns to patents. *Econ. J.*, Dec. 1986, 96(384), pp. 1052-76. New York University; Hebrew University.

Matanabe, Susumu—Labour-Saving versus Work-Amplifying Effects of Micro-Electronics

Based largely on a series of case studies of the automobile industry in different countries, this article argues that the labor-displacement effect of microelectronic machinery, especially numerically controlled machine tools and robots, has been exaggerated, and that people tend to confuse the impact of intensified international competition and the consequent rationalization programs with that of the new technology. In production work the new technology uses less labor saving than conventional fixed automation. Its very flexibility tempts users to put more work into each unit of final output, which offsets, to a greater or smaller degree, labor savings in preproduction work. *Int. Lab. Rev.*, May-June 1986, 125(3), pp. 243-59. International Labour Office.

### 630 INDUSTRY STUDIES

#### 31 Industry Studies: Manufacturing

Cartley, K.; Lavers, R. J. and Maynard, A. K.—Regulation and Development Times in the U.K. Pharmaceutical Industry

This paper tests the hypothesis that U.K. government regulation has led to longer development times and delays in the introduction of new drugs. The U.K. regulatory system is described and an empirical model is formulated and then tested for the period 1968-81. Some evidence is presented of delays in the processing of applications for clinical trials and product

licenses. *Scott. J. Polit. Econ.*, Nov. 1986, 33(4), pp. 355-69. University of York.

Holz, Arnold—Die Ausstattungsinvestitionen der schweizerischen Industrie. Desaggregierte Hochrechnungen 1969-1985 (Equipment Investment of Swiss Industry. Disaggregated Estimations 1969 to 1985)

The paper documents the attempt of estimating equipment investment of Swiss industry by quantitative survey data. First of all, a general view on economic and investment development since 1969 is given. Explanations of data base and method of estimation follow. The main subject is the presentation of disaggregated time series of industrial investment activity. Comparisons of investment intensities of Switzerland, Austria, and Germany support the plausibility of estimated time series. These data fill a critical gap in Swiss statistics. They may be of use in business observation as well as business research. *Schweiz. Z. Volkswirtschaft. Statistik.*, Dec. 1986, 122(4), pp. 677-96 (German). Konjunkturforschungsstelle and ETH Zurich, Zurich, Switzerland.

Joglekar, Prafulla and Paterson, Morton L.—A Closer Look at the Returns and Risks of Pharmaceutical R&D

Profitability of researching and developing new chemical entities (NCEs) over a 36-year investment horizon is projected, based on an R&D costs survey and on extensive U.S. sales data. After taxes, the average NCE produces a 6.1 percent real internal rate of return and a net present value of \$76 million (1976 dollars), but needs 12 years of sales to break even with an opportunity investment in corporate bonds. Risk is apparent in that two-thirds of NCEs return no more than the bonds do and the median NCE produces a negative return. A thorough sensitivity analysis is presented. *J. Health Econ.*, June 1986, 5(2), pp. 153-77. LaSalle University, Philadelphia; Smith Kline & French Laboratories, Philadelphia.

Löfgren, Karl Gustaf—The Pricing of Pulpwood and Spatial Price Discrimination: Theory and Practice

The purpose of this paper is to analyze the actual price list in a segment of the Swedish

paperwood market (price region 1) in terms of the theory of the spatial monopsony. It is argued that the recent construction of the price list is not inconsistent with an *a priori* hypothesis about a spatial monopsony facing, according to empirical data, a concave supply curve. A few qualifications are necessary: one is that the Swedish forest owners have not actively protested against the creation of the "price list." It is shown, however, that the chosen price policy may well be mutually advantageous in relation to adjacent alternatives. *Europ. Rev. Agr. Econ.*, 1985, 12(3), pp. 283-93. Swedish University of Agricultural Sciences.

Mariotti, Sergio and Cainarca, Gian Carlo—The Evolution of Transaction Governance in the Textile-Clothing Industry

This paper argues that the structural evolution of the textile-clothing industry is mainly the result of organizational innovations to economize on transactional costs and increase the dynamic efficiency of firms. The rise of managerial hierarchies in the coordination of diversified activities, the drop in the number of vertical hierarchical arrangements and the diffusion of intermediate governance structures are the main changes in industrial organization. There is evidence from the Italian industry that supports this trend. *J. Econ. Behav. Organ.*, Dec. 1986, 7(4), pp. 351-74. Politecnico di Milano and Centro di Teoria dei Sistemi del CNR, Milan; Politecnico di Milano.

Nowak, Jan and Romanowska, Hanna—Locational Patterns of the Food-processing Industry in Poland

Referring mostly to Alfred Weber's location theory and to works of E. M. Hoover, the authors make some hypotheses regarding the location orientations of various food processing industries. The authors employ simple methods of regional analysis in order to identify the actual location orientations of selected food-processing industries. The results of the empirical analysis confirm, to a large extent, the hypotheses made earlier. These considerations can yield premises on which location planners and policy-makers could act in the sphere of the food industry distribution and rural development. *Europ. Rev. Agr. Econ.*, 1985, 12(3), pp. 233-46.

Warsaw University; Polish Academy of Sciences.

635 Industry Studies: Services and Related Industries

Boyer, Marcel and Dionne, Georges—La tarification de l'assurance automobile et les incitations à la sécurité routière: Une étude empirique (The Tariffication of Car Insurances and the Incentives for Road Safety: An Empirical Investigation)

The authors analyze road safety as an economic good generating externalities and subject to moral hazard problems. They show how Pareto-superior multiperiod contracts can be designed and applied in the present context of the Quebec automobile insurance regime. To do so, it is estimated, by Probit methods and from a random sample of some 20,000 drivers' records over a 3-year period (August 1980 to July 1983), the probability that a given individual will be involved in an accident with bodily injuries. *Schweiz. Z. Volkswirtschaft. Statist.*, Sept. 1986, 122(3), pp. 293-321 (French). University of Montreal.

Doherty, Neil A. and Garven, James R.—Price Regulation in Property-Liability Insurance: A Contingent-Claims Approach

The authors use the option pricing model to derive the "fair" rate of return for the property-liability insurance firm. The rationale for the use of this model is that the financial claims of shareholders, policyholders, and tax authorities can be modeled as European options written on the income generated by the insurer's asset portfolio. By setting the value of the shareholders' option equal to the initial surplus, an implicit solution for the fair insurance price may be derived. Unlike previous insurance regulatory models, this approach addresses the ruin probability of the insurer, as well as nonlinear tax effects. *J. Finance*, Dec. 1986, 41(5), pp. 1031-50. University of Pennsylvania; Pennsylvania State University.

Henriet, Dominique and Rochet, Jean-Charles—La logique des systèmes bonus-malus en assurance automobile: une approche théorique (The Logic of the System of Bonuses and Penalties in Automobile Insurance: A Theoretical Approach)

Two justifications can be found for the use of a system of bonuses and penalties in automobile insurance. The first refers to risk selection; the second to the inducement to greater prudence at the wheel. Based on a model which incorporates both factors, it appears that the system of bonuses and penalties should be radically different depending on the primacy of one factor or the other. From the standpoint of risk selection, only the observed frequency of past accidents matters; but in order to incite safe driving the time element should enter in the allocation. In the light of the theoretical discussion, the French insurance clauses of 1976 and 1984 are reviewed. *Ann. Econ. Statist.*, Jan.-Mar. 1986, (1), pp. 133-52 (French). Laboratoire d'Économétrie de l'École Polytechnique; CEREMADE, University of Paris-IX.

#### Nonprofit Industries: Theory and Studies

Grant, James H. and Lindauer, David L.—The Economics of Charity: Life-Cycle Patterns of Alumnae Contributions

This paper examines the relationship between age and charitable contributions by considering the life-cycle pattern of educational donations by college alumnae. The income elasticity of such donations appears to increase with alumnae age. A second aim of the paper is to discuss the impact of fully anticipated reunions on the distribution of donations over a life cycle. Reunion years are found to increase significantly both the size and number of educational gifts relative to the estimated long-run trend in life-cycle giving. *Eastern Econ. J.*, Apr.-June 1986, 12(2), pp. 129-41. Wellesley College.

Leisbrod, Burton A. and Dominguez, Nestor D.—Demand for Collective Goods in Private Nonprofit Markets: Can Fundraising Expenditures Help Overcome Free-Rider Behavior?

Economic theory ascribes the primary role to the provision of public goods to government. Its emphasis on government overlooks the role of the not-for-profit sector in providing collective-type goods. In this paper the authors seek to determine the factors influencing charitable contributions to private nonprofit organizations by estimating a demand function for the

output of these collective-good providers. Specifically, the hypothesis that voluntary giving is responsive to conventional market variables such as advertising expenditures, price, and quality is tested. Overall, the results are strongly supportive. *J. Public Econ.*, June 1986, 30(1), pp. 83-96. University of Wisconsin-Madison; Federal Reserve Bank of New York.

#### 649 ECONOMIC CAPACITY

##### 641 Economic Capacity

Berndt, Ernst R. and Hesse, Dieter M.—Measuring and Assessing Capacity Utilization in the Manufacturing Sectors of Nine OECD Countries

Following a tradition established by J. M. Cassels, Lawrence Klein, and Bert G. Hickman, the authors define capacity as that output at which short- and long-run average total cost curves are tangent. They estimate a translog variable cost function for the manufacturing sectors of nine OECD countries. By the early 1980s, pervasive and chronic excess capacity exists. While the average cost consequence of excess capacity was modest in the 1960s, the burden increased considerably after OPEC-I, and after OPEC-II the premium was as large as 15 percent of average total costs. Electricity and fuel price increases had small impacts on capacity output relative to that from labor or capital. Adjusting conventional measures of multifactor productivity growth for changes in capacity utilization, it is found that adjusted growth is larger after 1973 than that suggested by traditional procedures. *Europ. Econ. Rev.*, Oct. 1986, 30(5), pp. 961-89. Massachusetts Institute of Technology; United Nations, Economic Commission for Europe, Geneva.

Driver, Ciaran—Transformation of the CBI Capacity Utilisation Series: Theory and Evidence

This paper reviews the conditions for a linear relationship between a true index of capacity utilization and that obtained by the CBI Industrial Trends Survey, which records the percentage of firms working below a satisfactory utilization. It is shown that the relationship depends on the distribution of capacity utilization among the firms in the sample. Empirical evidence is presented in favor of the normal distribution.

The parameters of this distribution are estimated under various assumptions with sensitivity tests; attention is given to the possibility that these parameters may vary over time. *Oxford Bull. Econ. Statist.*, Nov. 1986, 48(4), pp. 339-52. National Economic Development Office and Thames Polytechnic, London.

## 700 Agriculture; Natural Resources

### 710 AGRICULTURE

Herrmann, Roland, et al.—A Survey of Views of Agricultural Economists in Europe

This article presents the results of a statistical survey conducted at the Fourth European Congress of Agricultural Economists. First, the views of agricultural economists and the consensus and dissension among agricultural economists on issues that are important for planning agricultural policy are measured. Second, analysis of variance is applied to investigate the influence of personal characteristics of agricultural economists on their views in agricultural economics issues. It is shown that there are significant differences in views according to nationality and professional orientation. Coauthors are Uwe Jensen, Arno Schäfer and Heinrich Terwitte. *Europ. Rev. Agr. Econ.*, 1985, 12(3), pp. 295-311. Stanford University.

### 711 Agricultural Supply and Demand Analysis

Alauddin, Mohammad and Tisdell, Clem—Decomposition Methods, Agricultural Productivity Growth and Technological Change: A Critique Supported by Bangladeshi Data

This paper critically reviews and applies to Bangladesh three nonproduction function approaches to the decomposition of agricultural crop output growth. These methods (which decompose agricultural production growth into such sources as yield and area effects) do not explain the underlying growth process of agricultural output and restrictively assume constant crop yields on additional land. Price changes and differences in the degree of aggregation may bias results. These methods may incorrectly specify the sources of agricultural output growth flowing from the Green Revolution and, in particular, conceal the importance of greater frequency of cropping as a source of growth. *Oxford Bull. Econ. Statist.*, Nov. 1986,

48(4), pp. 353-72. Rajshahi University, Bangladesh; University of Newcastle, New South Wales, Australia.

Capalbo, Susan M. and Denny, Michael G. S.—Testing Long-run Productivity Models for the Canadian and U.S. Agricultural Sectors

The primary objective of this paper is to develop the linkages between the gross and net productivity indexes and the implied production structures. These linkages are developed as separability restrictions on various subgroups of inputs and time in a general production model. The restricted models are arranged in sequences for nested hypotheses testing. Empirical evidence from the U.S. and Canadian agricultural sectors based on a translog production function supports the gross output total factor productivity structure. The net output Hicks neutrality hypothesis is rejected for both the United States and Canada. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 615-25. Resources for the Future, Washington, D.C.; University of Toronto.

Paarlberg, Philip L. and Abbott, Philip C.—Oligopolistic Behavior by Public Agencies in International Trade: The World Wheat Market

A model of the world wheat market is presented that treats public policies as endogenous. The oligopolistic nature of international wheat trade is captured by assuming policymakers form conjectures on the slope of the excess demand function they face and use that information to determine domestic and trade policies. The policies reflect differing influences of political interest groups. A U.S. crop-shortfall scenario illustrates the different results with endogenous policies compared to the traditional model. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 528-43. Purdue University.

Unnevehr, Laurian J.—Consumer Demand for Rice Grain Quality and Returns to Research for Quality Improvement in Southeast Asia

Abundant world rice supply has led to renewed interest in improving grain quality modern rice varieties. Implicit prices of grain characteristics are estimated for Thailand,

donesia, and the Philippines. These prices are used to evaluate rice-breeding goals and to estimate returns to research for quality improvement. Results indicate that the past focus on physical quality improvement was appropriate, and future welfare gains are possible from chemical quality improvement. Returns to quality improvement are substantial and indicate underinvestment in this type of research. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 634-41. University of Illinois.

**713 Agricultural Policy, Domestic and International**

**Bingley, Pam; Burton, Michael and Strak, John**—Inter- and Intra-sectoral Effects of Milk Quotas in the U.K. Milk Industry

The effects of milk quotas in the United Kingdom on farmers, their suppliers, and on the processing industries are investigated using a small econometric model. The model equations are derived from estimates of technical and economic relationships in the U.K. milk industry without an undue emphasis on an all-embracing theoretical optimization process. Reductions in herd size, reductions in cow yield, and a combination of herd and yield reductions are examined. The resulting simulations over a five year period from 1984 to 1988 imply that it is not just the overall level of quota production that is important. The methods by which farmers adjust to the new limits are also very significant. *Europ. Rev. Agr. Econ.*, 1985, 12(4), pp. 411-30. University of Manchester.

**Burrell, Alison**—Price Uncertainty under EC Milk Quotas—The current arrangements for applying the super levy under the Formula B option introduce a new element of price uncertainty into milk production decisions. In these circumstances it may be rational for individual producers to exceed their quota. Cyclical fluctuations in aggregate supply could develop, with implications for the efficiency of resource allocation and current dairy policy. *Europ. Rev. Agr. Econ.*, 1985, 12(4), pp. 335-50. University of London.

**Burton, Michael**—The Implementation of the EC Milk Quota

This paper presents a model that attempts to explain the recent implementation of the EC

milk quota. A preference function for the Council of Ministers is presented, which has been estimated using historical milk sector intervention prices. By maximizing this preference function to the constraints imposed by a milk sector submodel, it is possible to derive a forecast of the level of milk quota for two years: 1990/91, where the results are compared with those generated by the model when a quota mechanism is not used, and for 1984/85, when the results are compared with the actual decision taken by the Council. *Europ. Rev. Agr. Econ.*, 1985, 12(4), pp. 461-71. University of Manchester.

**Cioffi, Antonio, et al.**—An Evaluation of the Effects of the EC Quota System on the Italian Dairy Market

The integration of Italy into the EC led to a spectacular increase of milk imports during the 1970s, in spite of the increase in domestic production. Using an econometric model of the Italian dairy sector, it is shown that, had quota been established in 1980, imports would have increased even more and, when combined with a price decrease, imports of cheese would also have increased. These effects are comparable to those of a price decrease (without quota) of 9 percent. Coauthors are Francesco Polverini, Carlo Perone-Pacifico and Alessandro Sorrentino. *Europ. Rev. Agr. Econ.*, 1985, 12(4), pp. 389-400. University of Naples.

**Colman, David**—Imperfect Transmission of Policy Prices

It is commonly assumed that changes in agricultural policy prices cause equal changes in wholesale and producer prices. In other words, there is "perfect transmission" of policy prices. This paper sets out reasons why such perfect transmission does not occur in practice. Econometric results for U.K. feed cereal prices support the argument. *Europ. Rev. Agr. Econ.*, 1985, 12(3), pp. 171-86. University of Manchester.

**van der Giessen, Leon B. and Post, Jaap H.**—Macro- and Micro-effects of the Super Levy in the Netherlands

This article deals with the consequences of a decline in milk production for the Dutch economy. On the basis of theoretical investigations

and of the first information from practice, an opinion is given on the way dairy farmers in the Netherlands will react to the super levy. On the basis of reactions in the dairy sector and in connected industries the short-term effects on income and employment are calculated with help of input-output analysis. Also a short sketch is given of the effects in the longer term. *Europ. Rev. Agr. Econ.*, 1985, 12(4), pp. 449-60. Landbouw-Economisch Instituut, the Hague.

**Hamilton, Carl—Agricultural Protection in Sweden 1970-1980**

Protection in Sweden increased from 70 percent *ad valorem* tariff equivalent during 1970-72 to 80 percent during 1976-80. Dairy products and beef were particularly highly protected. Protection could not be measured by variable levies only. Price subsidies and the negotiating element in decisions on levies made direct price comparisons necessary. Approximate effective rates of protection were also estimated. Both nominal and effective rates were found to be lower than in the EC. Finally, the national defense argument about self-sufficiency in food supply was compared with present levels of production and the total cost of surplus production was estimated. *Europ. Rev. Agr. Econ.*, 1986, 13(1), pp. 75-87. University of Stockholm.

**Hedlund, Stefan and Lundahl, Mats—Emergency Considerations in Swedish Agriculture: A Retrospective Look**

This paper focuses on one important objective of Swedish agricultural policy, that of emergency considerations. By making a broad historical sweep—from the outbreak of World War I to the present—it is shown how that policy objective has emerged and developed over time. The main contention of the paper is that the need to be prepared for disruptions in agricultural trade—due to war or other emergencies—has been improperly advanced as an argument in favor of an overdimensioned agricultural sector. *Europ. Rev. Agr. Econ.*, 1986, 13(1), pp. 89-105. University of Lund.

**Hillberg, Ann Marie—Limiting EC Grain Substitute Imports: A Simulation Model of the**

**West German Manufactured Feed Economy**

EC measures to limit grain substitute imports are evaluated using a simulation model of the West German northern and southern manufactured feed economy, including ingredient supply and compound feed demand functions. These results show that restrictions on manioc or corn gluten feed imports have only limited success in increasing feedgrain demand by West German feed manufacturers. The impact of changes in ration composition favoring grains are dampened by the accompanying higher finished ration costs. In contrast, lowered grain prices lead not so much to changed ration composition as to lowered finished ration prices and a resulting increased demand for the final product. *Europ. Rev. Agr. Econ.*, 1986, 13(1), pp. 43-56. Purdue University.

**Kirschke, Dieter—Budget Costs of the EC's Agricultural Price Policy under Uncertainty**

Budget costs under the EC's agricultural price policy are subject to several determinants, which cannot be predicted with certainty. In the empirical part of the paper, the considerable extent of budget costs uncertainty is revealed. Basically, budget costs uncertainty exists because domestic and world market supply and demand are stochastic. The consequences of this kind of uncertainty are analyzed in the theoretical part of the paper. Expected budget costs are shown to be often higher than their hypothetical certainty values. Moreover, several factors are found that enhance budget costs variance in the present surplus situation on EC agricultural markets. *Europ. Rev. Agr. Econ.*, 1986, 13(1), pp. 57-74. EC Commission, Brussels.

**Rieder, Peter—Experience with the Milk Quota System in Switzerland**

The individual farmers' reactions have been threefold: they have made requests for higher quotas; they have filled up the quotas where gaps were available; and they have changed their production structure. The last-mentioned reaction was characterized by a reduction in the number of cows, by the production of more fodder crops, and by heifer production in the plain region. Traditional heifer producers in the

mountain area reacted with a higher milk and beef production. As a consequence, the division of labor between plain and mountain regions in milk and heifer production is diminished. *Europ. Rev. Agr. Econ.*, 1985, 12(4), pp. 473-79. Federal Institute of Technology, Zurich.

Thomson, Kenneth J. and Hubbard, Lionel J.—Budgetary and Financial Effects of the EC Milk Quota System

Results are reported from using an existing model of the Common Agricultural Policy (CAP) to analyze the quota scheme introduced by the European Community in April 1984. Results are presented for the three years 1984, 1985, and 1988. Constraining milk production causes the Community to become more self-sufficient in cereals, but slightly less so in livestock products. By 1988, net FEOGA expenditure in the milk sector is estimated to be around 40 percent less with the quota policy than under continued pre-1984 policy, though total net FEOGA expenditure is reduced by only half this amount. As would be expected, taxpayers' savings are estimated to exceed greatly the loss suffered by dairy producers. *Europ. Rev. Agr. Econ.*, 1985, 12(4), pp. 381-88. University of Newcastle upon Tyne.

Ulrich, Alvin; Furtan, William H. and Schmitz, Andrew—The Cost of a Licensing System Regulation: An Example from Canadian Prairie Agriculture

Agricultural legislation and the resultant regulation that usually ensues can often change, redirect, or even stop the adoption of yield-increasing technologies that have the potential to generate substantial economic rents. This paper offers an example from the Canadian wheat sector of how a variety-licensing regulation totally stopped the adoption of a yield-increasing technology that had the potential to increase the economic rents flowing to western Canadian farmers by 15-25 percent. This regulation further prevented high internal rates of return (greater than 50 percent) from being generated by research into this new technology. *J. Polit. Econ.*, Feb. 1987, 95(1), pp. 160-78. University of Saskatchewan, Saskatoon; University of Saskatchewan, Saskatoon; University of California, Berkeley.

#### 714 Agricultural Finance

Calomiris, Charles W.; Hubbard, R. Glenn and Stock, James H.—The Farm Debt Crisis and Public Policy

U.S. farms, and with them agricultural lending institutions, are currently experiencing their most severe stress since the 1930s. The authors examine state-level panel data on farm incomes and balance sheets and loans from financial intermediaries, finding that disruptions in agricultural credit markets can have real effects on farm output. Unlike credit markets for large firms or for firms for which monitoring is less costly, agricultural financial markets require close customer arrangements. Local financial institutions are often unable to diversify their loan risks either within agriculture or across other geographically separated activities. Implications for government intervention in agricultural credit markets are discussed. *Brookings Pap. Econ. Act.*, 1986, (2), pp. 441-79. Northwestern University; Northwestern University; Harvard University.

Severn, Alan K.—Taxation of Federal Land Banks: Competitive Effects

The federal land banks are now exempt from all income taxes. This paper presents a model of the response of federal land bank volume and rates to taxation. In the model, the members of this borrowers' cooperative minimize their own explicit and implicit borrowing costs. In doing so, they reduce the scale of the tax exempt federal land bank. By contrast, taxation would cause a federal land bank to choose a scale larger than that which would prevail in the absence of all taxes. Therefore, taxation of federal land banks would increase their already dominant share of the market for farm real estate lending. Self-imposed restrictions limited their exposure to falling land prices, and build a larger surplus to absorb loan losses. *Quart. J. Bus. Econ.*, Autumn 1986, 25(4), pp. 41-55. Temple University.

#### 715 Agricultural Markets and Marketing

Kinnaman, Henry and Forster, Olan D.—Seasonality in the Consumer Response to Milk Advertising with Implications for Milk Promotion Policy

Permitting seasonal variation in the goodwill effect in measuring the impact of fluid milk advertising on milk sales in New York City improved the statistical significance of the estimating equation. The allocation of generic advertising dollars according to optimization rules during the period 1979-81 would have resulted in a 9 percent increase in returns to dairymen supplying the New York City market. Harmonic variables are used to account for seasonality, a Pascal distribution is used to account for the decay structure, and goodwill elasticities are estimated to indicate the impact of generic advertising on sales. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 562-71. Auburn University; Cornell University.

#### 716 Farm Management

Byerlee, Derek and Hesse de Polanco, Edith—Farmers' Stepwise Adoption of Technological Packages: Evidence from the Mexican Altiplano

Agricultural research and extension programs in developing countries, rather than following the conventional package approach, should be designed to take into account the fact that farmers adopt improved technological components in a stepwise manner. On-farm experimental and survey data collected from two rainfall zones in a high valley of Mexico are synthesized to show that farmers have rationally followed a stepwise process of adopting improved varieties, fertilizer, and herbicide for barley, reflecting the relative profitability and riskiness of each component in each zone. Despite significant interactions between the components, it was still possible for farmers to adopt individual components in a sequential manner. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 519-27. International Maize and Wheat Improvement Center, Pakistan; International Maize and Wheat Improvement Center, Mexico.

Just, Richard E. and Candler, Wilfred—Production Functions and Rationality of Mixed Cropping

This paper reports on the estimation of crop yield equations in the context of mixed cropping where several crops are grown on the same plot. The empirical results are based on data from northern Nigeria. The results show that

these seemingly haphazard crop mixes provide a useful opportunity for matching production decisions to risk preferences as the growing season evolves. Using observed prices in two different time periods, eight out of twenty crop mixes (all involving a subset of the same six crops) fall on the empirical mean-variance frontier, and nine others are not dominated by any crop mix not on the frontier. Furthermore, some variation from the absolute frontier may be explained by imperfectly anticipated prices. *Europ. Rev. Agr. Econ.*, 1985, 12(3), pp. 207-31. University of Maryland and World Bank; World Bank.

McKinzie, Lance; Paarlberg, Philip L. and Huerta, Ivan P.—Estimating a Complete Matrix of Demand Elasticities for Feed Components Using Pseudo Data: A Case Study of Dutch Compound Livestock Feeds

A complete set of direct- and cross-price elasticities of demand for livestock feed ingredients in the Netherlands is estimated using a relatively new approach. Cost minimizing behavior of compound feed manufacturers is modeled in a linear programming formulation. That formulation is then approximated by fitting a smooth cost function to optimal solutions over a sample of different feed ingredient prices. Elasticities are then evaluated along the smooth curve. *Europ. Rev. Agr. Econ.*, 1986, 13(1), pp. 23-42. Purdue University; Purdue University; Catholic University, Santiago.

Rasmussen, Svend and Nielsen, A. Hjortshøj—The Impact of Quotas on the Optimal Adjustment of Milk Production at the Farm Level

An economic model is developed for the optimal adjustment of milk production on an individual farm faced with a delivery quota. The model is based on the general neoclassical theory of production, taking into account the complicated relations between the production of milk and beef. The application of the model is illustrated by some examples with varying assumptions. The results show that in the short and medium term, the adjustment should take place by a simultaneous reduction in the feed input and in the number of cows in the herd. As expected, the long-run adjustment should take place only by a reduction in the number

of cows. *Europ. Rev. Agr. Econ.*, 1985, 12(4), pp. 351-64. The Royal Veterinary and Agricultural University, Copenhagen, Denmark.

Shoes, Jerry R. and Reed, Michael R.—Rate Making for Farm-Level Crop Insurance: Implications for Adverse Selection

This research identifies two problems in the new Federal Crop Insurance that may cause adverse selection: (1) the relationship between rate making and expected yields for individual farmers, and (2) the bias introduced in coverage protection when trends are not used to establish expected yields. A theoretical investigation using the normality assumption demonstrates the potential severity of these problems, and empirical results from farm-level data lend further support. As crop insurance changes to individualized methods of protection, these issues will be particularly important for developing rates. *Amer. J. Agr. Econ.*, Aug. 1986, 63(3), pp. 653-59. University of Kentucky.

Smith, Edward G.; Knutson, Ronald D. and Richardson, James W.—Input and Marketing Economies: Impact on Structural Change in Cotton Farming on the Texas High Plains

This study isolates the degree of pecuniary economies existing for input purchases and marketing on cotton farms in the Texas southern high plains. The results indicate that substantial cost and marketing economies are being realized by the largest farms in the region. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 716-20. Texas A&M University.

Trapp, James N.—Investment and Disinvestment Principles with Nonconstant Prices and Varying Firm Size Applied to Beef-Breeding Herds

Variable beef-breeding herd sizes are found to be optimal given cyclical beef prices. Traditional replacement theory does not allow variable firm size because unequal investment (replacement) and disinvestment (culling) rates are not possible. If firm size changes, cost of production per unit endogenously changes given a U-shaped cost curve. Optimal investment and disinvestment rules for variable firm size are developed based upon the firm's cost curve and discounted net revenue flows for a finite rolling planning horizon. Current and future invest-

ment and disinvestment decisions are linked by their mutual effect on firm size and hence production cost per unit. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 691-703. Oklahoma State University.

Zacharias, Thomas P. and Grube, Arthur H.—Integrated Pest Management Strategies for Approximately Optimal Control of Corn Rootworm and Soybean Cyst Nematode

A dynamic programming model is used to determine approximately optimal management strategies for control of corn rootworm and soybean cyst nematode in Illinois. Decision alternatives for rootworm control include nontreatment, application of a soil insecticide, and rotation to soybeans. Alternatives for cyst nematode control are nontreatment, soil nematocide, resistant cultivars, and rotation to corn. State variables in the dynamic programming model are infestation levels of both pests, previous land-use decisions, and expected product prices. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 704-15. Louisiana State University; University of Illinois.

#### 717 Land Reform and Land Use

Berck, Peter and Levy, Annon—The Costs of Equal Land Distribution: The Case of the Israeli Moshavim

Equal land distribution achieved by government policy may adversely affect aggregate output. Israeli *moshavim* (cooperative villages) operate under an equal land allocation rule. This study assesses the production and distribution consequences of two alternative hypothetical allocation rules; a free market allocation, and a policy that maximizes value-added without discrimination based on nativity or ethnicity. Production and supply functions are estimated using sample data on Israeli family farms. Then the three allocation rules are simulated. The output loss from distributing land equally is found to be modest compared to the income inequality generated by the other rules. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 605-14. University of California, Berkeley; Ben Gurion University of the Negev, Israel.

Braverman, Avishay and Stiglitz, Joseph E.—Cost-Sharing Arrangements under Share-

**Cropping: Moral Hazard, Incentive Flexibility, and Risk**

This paper explains the rationale and describes the characteristics of cost-sharing arrangements in rural developing economies, focusing on the risk and incentive properties of alternative cost contracts and on their flexibility—their ability to adapt to environmental changes. It is shown that where labor inputs are difficult to monitor, the rule that cost shares and output shares be equalized will not hold and is not “constrained Pareto efficient,” and that cost-sharing contracts have a decided advantage over contracts that specify the level of inputs whenever there are asymmetries of information regarding production technology between the landlord and the tenant. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 642–52. World Bank; Princeton University.

**Pohoryles, Samuel—Agricultural Emancipation in a Semi-Arid Ecosystem**

The most acute and crucial agricultural and food problems are focused in developing countries. About 60 percent of the necessary agricultural growth in developing countries is linked to improved land–water strategy. Israel is a classic example of unfavorable distribution of natural resources. Middle East experts have evaluated that this region requires a whole generation (25 years) to get its food production doubled. During 25 years Israel's agriculture increased twelvefold in real terms—10 percent annually. This was achieved by “correction of the nature” (water carrier), gradual substitution of land and water by “neutral” technology, and heterogenization of rural economy. *Konjunkturpolitik*, 1986, 32(3), pp. 164–78. Ministry of Agriculture, Israel.

**Seclder, David W.—Institutionalism and Agricultural Development in India**

This paper shows how institutional theory, especially that of J. Fagg Foster, and management theory can be applied to agricultural projects in developing countries. The case study is the “Sukhamajri Project,” an irrigation and soil conservation project in India sponsored by the Ford Foundation. An interesting feature of this project is a completely egalitarian distribution of irrigation water among all households

in the village, irrespective of land ownership. Each household is given an equal quantity of water right, which it can then “truck, barter, and exchange.” Various principles of institutional/managerial theory are discussed and related to this project. *J. Econ. Issues*, Dec. 1986, 20(4), pp. 1011–27. Colorado State University.

**720 NATURAL RESOURCES**

**721 Natural Resources**

**Amigues, Jean-Pierre and Moreaux, Michel—Gravières et vins de Bordeaux (Gravel Pits and Bordeaux Wines)**

Sand and gravel mining is one of the main extractive industries in France. Extraction implies generally a loss of some agricultural potential, i.e., the destruction of some agricultural asset. Such a problem has recently arisen in the Bordeaux area, well known for its wine. In this paper, the authors show how the gravel extraction and agricultural output paths will be determined in a system of competitive markets. *Ann. Econ. Statist.*, Jan.–Mar. 1986, (1), pp. 75–105 (French). CREMAQ, University of Social Sciences of Toulouse.

**Anderson, F. J.—Valuing a Depletable Resource Endowment in an Open Economy**

A simple general equilibrium structure is used to model the welfare effect of the hypothetical loss of a depletable resource endowment in an open economy. The Hicksian equivalent surplus measure is used as the welfare indicator. Three types of loss are identified: the elimination of rents along the optimal extraction path, loss of producers' surplus associated with (strict) concavity of the economy's transformation frontier in nonresource inputs, and a terms-of-trade loss. The latter reflects the economy's excess demand for the resource in the absence of its own endowment and is zero if it is a price taker in world markets. *Can. J. Econ.*, Nov. 1986, 18(4), pp. 730–44. Lakehead University, Thunder Bay, Ontario.

**Anderson, Lee G. and Lee, Dwight R.—Optimal Governing Instrument, Operation Level, and Enforcement in Natural Resource Regulation: The Case of the Fishery**

Most regulation studies have used industry output or inputs as the control variable(s), but

these are only indirectly controlled by government action through its choice of governing instrument, enforcement procedure, and penalty structure and the operational level of each. A model is developed that demonstrates how profit-maximizing firms will react to these control variables taking into account the benefits (extra production) and costs (possible penalties) of noncompliance and the ability to avoid detection of noncompliance. The optimal operation level for two sets of control variables is derived and discussed. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 678-90. University of Delaware; University of Georgia.

**Anderson, Terry L. and Johnson, Ronald N.—The Problem of Instream Flows**

To obtain a surface water right in the arid American West, private appropriators have been required to undertake actual physical diversion of the water. That requirement largely negates the role of private contracting to preserve or enhance water flows for recreational, wildlife, and aesthetic purposes. In this paper a model is developed and used to examine the courts' rationale for denying private claims to instream flows. The ways in which such claims can be made amenable to the prior appropriation system are explored. The paper is motivated by the failure of public agencies to achieve an approximately optimal solution. *Econ. Inquiry*, Oct. 1986, 24(4), pp. 535-54. Montana State University.

**Capalbo, Susan M.—Temporary Equilibrium Production Models for a Common-Property Renewable-Resource Sector**

Temporary equilibrium production models for a common-property, renewable-resource sector are developed and used to measure the shadow value of the resource. The structure of these models incorporates the biological dynamics and the ownership rights. Under sole ownership, the firm chooses the utilization level of the resource stock, which in turn affects his investment policy in the resource. For an open-access fishery, the firm behaves as if the shadow value was zero. To measure the shadow values for an open-access fishery, a model of downstream market behavior is proposed. This model is implemented for the North Pacific hal-

ibut fishery. *J. Econometrics*, Oct./Nov. 1986, 33(1/2), pp. 263-84. Resources for the Future, Washington, D.C.

**Comolli, Paul M.—Exhaustible Resources and International Trade**

This paper extends on the optimal growth/exhaustible resource model of P. Dasgupta and G. Heal (*Rev. Econ. Studies*, December 1974) to include international trade in the resource and a produced composite good. In contrast to recent studies that have utilized small open-economy assumptions, the analysis determines the terms of trade and rate of interest endogenously within a two-country setting. This determination allows the author to investigate the intertemporal patterns of trade and specialization that may possibly arise. Countries are assumed to have identical Cobb-Douglas technologies but different preferences and initial factor endowments. *Eastern Econ. J.*, July-Sept. 1986, 12(3), pp. 291-96. University of Kansas.

**Deller, Steven C.; Chicoine, David L. and Ramamurthy, Ganapathi—Instrumental Variables Approach to Rural Water Service Demand**

The alternative instrumental variable techniques for dealing with measurement error and simultaneity feedback associated with studying water demand, where water is sold through discrete block prices, are developed and compared with OLS estimates in this paper. Household data on rural water service customers are used to estimate demand. The results support rejecting OLS estimates in favor of the instrumental approach and do not support the Taylor/Nordin demand specification as appropriately capturing rural water service customer behavior. *Southern Econ. J.*, Oct. 1986, 53(2), pp. 333-46. University of Illinois; University of Illinois; State Water Survey, State of Illinois.

**Fox, William F. and Hoffer, Richard A.—Using Homothetic Composed Error Frontiers to Measure Water Utility Efficiency**

A composed error, dual output production function is used to measure the production and cost frontiers for a sample of rural U.S. water producers. Contributions of the paper include explicitly accounting for the separable outputs

of water production and distribution; defining the concepts of absolute and relative efficiency and measuring each; and quantifying both allocative and technical inefficiency for each firm. Also, the extent of inefficiency in the delivery of water services is compared for private and public water producers to determine which performs best relative to its potential, with the conclusion that they have equal absolute degrees of inefficiency. *Southern Econ. J.*, Oct. 1986, 53(2), pp. 461-77. University of Tennessee.

Karp, Larry; Sadeh, Arye and Griffin, Wade L.—Cycles in Agricultural Production: The Case of Aquaculture

The problem of determining optimal harvest and restocking time and levels is considered. A continuous time deterministic control problem is used to study the case where production occurs in a controlled environment. A stochastic control problem is then used to determine rules for the cultivation of *P. stylirostris*, which occurs in a stochastic environment. The deterministic analog of the problem is also solved. The two solutions are used to develop a measure for the value of a controlled environment and for the value of information about the stochastic environment. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 553-61. University of California, Berkeley; Texas A&M University; Texas A&M University.

Karpoff, Jonathan M.—Suboptimal Controls in Common Resource Management: The Case of the Fishery

The discrepancy between elaborate proposals to "solve" the common pool fishery problem and actual fishery regulations is examined. The self-interest hypothesis of regulation and fisherman heterogeneity can explain two historically popular types of fishery regulations: season closures and capital constraints. These have differential impacts on fishermen and typically redistribute the fishery's harvest from more efficient toward less efficient producers. To the extent that fishermen are antagonistic to a regulatory body's jurisdiction they tend to be relatively inefficient, it is predicted that these regulations will withstand the theory and data that demonstrate their suboptimality. *J. Polit. Econ.*, Feb.

1987, 95(1), pp. 179-94. University of Washington, Seattle.

Kealy, May Jo and Bishop, Richard C.—Theoretical and Empirical Specifications Issues in Travel Cost Demand Studies

A travel cost demand model is derived from a utility function that postulates that individuals choose the optimal total number of site recreation days given by the product of the number and length of their recreation trips. By relaxing the assumption that onsite time is constant across recreationists, the applicability of the travel cost method is extended. The model is estimated using a maximum likelihood procedure appropriate for the truncated sample data, which is characteristic of most user-specific recreation data. Failure to do so would result in overestimating the value of Great Lakes fishing by 3.5 times. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 660-67. Colgate University; University of Wisconsin.

Lee, Seung-Dong—On the Theory of an Exhaustible Resource Extractive Multinational Firm

The exhaustible resources extracted by the foreign affiliate become intermediate goods both at home and in the foreign country. The foreign affiliate produces final products and sells them within the country, while the parent firm produces the same products and sells them at home as well as to the foreign country. This paper analyzes the behavior of the multinational firm and commercial and resource conservation policy implications for each country. Much attention is paid to the role of the exhaustible resource and the dynamics of variables. *Can. J. Econ.*, Nov. 1986, 19(4), pp. 716-29. University of Alabama.

Livernois, John R. and Uhler, Russell S.—Extraction Costs and the Economics of Nonrenewable Resources

The study questions the fundamental assumption of the standard aggregate exploration-extraction model of nonrenewable resources that extraction costs and the level of reserves are inversely related. It also raises questions about the model's conclusions regard-

ing exploration incentives and the valuation of reserves. An empirically tested disaggregate model is presented that suggests that exploration activity occurs from firms attempting to balance marginal extraction plus user costs at the intensive and extensive margins. Exploration is carried out until the marginal discovery cost of a deposit equals its present asset value and a U-shaped price path is indicated. *J. Polit. Econ.*, Feb. 1987, 95(1), pp. 195-203. University of Alberta, Edmonton; University of British Columbia, Vancouver.

Mitra, Tapan and Wan, Henry Y., Jr.—On the Faustmann Solution to the Forest Management Problem

This paper is concerned with optimal solutions to the forest management problem when future utilities are not discounted. By examining asymptotic properties of such solutions, the authors find that: (1) if the utility function is linear, then the Faustmann periodic solution is optimal; (2) if the utility function is increasing and strictly concave, an optimal solution converges to the maximum sustained yield solution, which is characterized as a golden rule. These results may be viewed as a possible resolution to the debate in forestry economics about what constitutes an optimal policy in forest management. *J. Econ. Theory*, Dec. 1986, 40(2), pp. 229-49. Cornell University.

Mueller, Michael J. and Eubanks, Larry S.—Institutional Effects on an In Situ Natural Resource Market: Forced Pooling in a Petroleum Reserves Market

This paper finds that use of forced pooling in the acquisition of oil and gas leases in Oklahoma resulted in additional petroleum reserves. Forced pooling also increased acreage leased, investment in acreage and wells, and wells drilled. A simultaneous equation model of the petroleum reserves market based on inputs used in developing reserves was estimated. Original data on forced pooling orders, including lease bonus payments, was collected from state legal records. A forced pooling order allows the owner of a fractional drilling unit share to force all other owners to consent to drilling, it is not unitization. *Southern Econ. J.*, Oct. 1986, 53(2), pp. 374-82. Clarkson Uni-

versity, Potsdam, New York; University of Colorado.

## 723 Conservation and Pollution

Bongaerts, Jan C. and Heinrichs, Dirk—Deutsche Umweltschutzgesetze und Umweltschutzinvestitionen des produzierenden Gewerbes (German Environmental Protection Legislation and Environmental Investment by West German Manufacturing Industries)

The paper explores the impact of environmental regulations on environmental protection investment expenditures by thirty-seven West German industries. Its main conclusion states that interindustry differences in these expenditures can be explained by interindustry differences in environmental protection legislation. Besides the influence of the law these investments are also explained by economic variables like cash flow and industry structure. Measurement of the impact of the law takes place by assessing the cumulative effect of industry-specific environmental regulations over time as well as the intensity with which these regulations affect each industry. *Konjunkturpolitik*, 1986, 32(3), pp. 151-63 (German). Science Center Berlin, West Germany.

Endres, Alfred—Charges, Permits and Pollutant Interactions

An environmental quality indicator allowing for pollutant interactions is assumed to exist. The presupposed policy goal is to meet a certain standard in terms of this indicator. Alternative instruments to achieve the target at minimum cost are analyzed. With the simplest term of interaction, the properties of the instruments do not deviate much from what is known from the traditional literature on noninteractive pollutants. When interaction is complex, however, the iterative process to attain the target by efficient charges is more cumbersome. Moreover, nonconvexities may arise, making transferable discharge permits lose their widely acknowledged efficiency property. *Eastern Econ. J.*, July-Sept. 1986, 12(3), pp. 327-36. Technical University of Berlin.

Shortle, James S. and Dunn, James W.—The Relative Efficiency of Agricultural Source Water Pollution Control Policies

This paper examines the relative expected efficiency of four general strategies that have been proposed for achieving agricultural non-point pollution abatement. Emphasis is placed on the implications of differential information about the costs of changes in farm management practices, the impracticality of accurate direct monitoring, and the stochastic nature of non-point pollution. The possibility of using hydrological models to reduce, but not eliminate, the uncertainty about the magnitude of non-point loadings is incorporated into the analysis. The principal result is that appropriately specified management practice incentives should generally outperform estimated runoff standards, estimated runoff incentives, and management practice standards for reducing agricultural nonpoint pollution. *Amer. J. Agr. Econ.*, Aug. 1986, 68(3), pp. 668-77. Pennsylvania State University.

Smith, V. Kerry and Desvousges, William H.—An Empirical Analysis of the Economic Value of Risk Changes

This paper reports detailed empirical tests of how an individual's valuation of a risk change varies with the level of the baseline risk. The findings reject the conventional hypothesis and indicate that the estimated marginal valuation of a risk change decreased with increases in the level of risk. They also indicate that the direction of the risk change and perceived entitlements to safety affect the reported marginal valuations. The specific application involves a contingent valuation analysis based on the responses of a representative sample of households in suburban Boston to proposed reductions in the risks of exposure to hazardous wastes. *J. Polit. Econ.*, Feb. 1987, 95(1), pp. 89-114. Vanderbilt University; Research Triangle Institute, North Carolina.

### 733 Energy

Dubin, Jeffrey; Miedema, Allen K. and Chandran, Ram V.—Price Effects of Energy-Efficient Technologies: A Study of Residential Demand for Heating and Cooling

Energy efficient appliances reduce the marginal price of the services they deliver. This article shows empirically that such price reductions result in energy savings that are smaller

than those engineering techniques generally project. Using econometric techniques with data from a unique utility experiment and a detailed engineering-thermal load model, the authors find that actual conservation is as much as 13 percent below engineering estimates for cooling and 8 to 12 percent below for heating. Customers who conserve electricity are also persistent; their houses are comparatively warmer in summer and cooler in winter. *Rand J. Econ.*, Autumn 1986, 17(3), pp. 310-25. California Institute of Technology; Research Triangle Institute, Triangle Park, North Carolina; Research Triangle Institute.

Gately, Dermot—Lessons from the 1986 Oil Price Collapse

This reviews the details and the background of the 1986 oil price collapse, discusses whether it was or was not a surprise, and what it means for oil prices in 1986-87 and over the longer term. It includes the following sections: an overview of the 1970-86 data and expert opinion; an explanation of the 1986 price collapse, together with a simulation of the choices facing OPEC for 1986 and thereafter; an examination of the question of what should have been expected for 1985-86; and a discussion of the outlook for the world oil market, both short term and long term. *Brookings Pap. Econ. Act.*, 1986, (2), pp. 237-71. New York University.

Kalt, Joseph P. and Leone, Robert A.—Regional Effects of Energy Price Decontrol: The Roles of Interregional Trade, Stockholding, and Microeconomic Incidence

Policy debates over energy pricing frequently pit "producing states" against "consuming states." Such a distinction ignores the fact that ownership of energy-producing and energy-using assets is geographically dispersed, and that trade links regional economies. Incorporating these factors as well as alternative patterns of the incidence of higher gas prices into an analysis of natural gas decontrol reveals a significant influence on the net interregional transfers resulting from decontrol. Apparent "consuming" regions could benefit from gas decontrol, and "consuming" regions generally do not benefit from policies that tax producer windfalls from

control and then redistribute the revenues compensation to gas users. *Rand J. Econ.*, summer 1986, 17(2), pp. 201-13. Harvard University.

### 800 Manpower; Labor; Population

#### 10 MANPOWER TRAINING AND ALLOCATION; LABOR FORCE AND SUPPLY

##### 3 Labor Force

enn, P. T. and Vlachonikolis, I. G.—Male Labour Force Participation Following Illness or Injury

This paper develops a model of the disabled individual's labor force participation decision following illness or injury, and confronts it with data on the financial consequences of ill health. A utility function is specified, which allows for the effect of changes in health on work-leisure preferences, and is evaluated in relation to a household budget constraint. Estimation is through maximization of the appropriate likelihood function, correcting for self-selection bias within a switching regression model. Results are presented showing significant effects of financial variables on participation, and these are seen to vary with age, disability, and income. *Economica*, Aug. 1986, 53(211), pp. 379-91. Oxford University.

oterba, James M. and Summers, Lawrence H.—Reporting Errors and Labor Market Dynamics

This paper estimates the incidence of response errors in the Current Population Survey. It proposes a procedure for adjusting the Bureau of Labor Statistics' gross flows data on labor market transitions to account for these errors. The findings illustrate the potentially substantial effect of response errors on studies of labor market behavior. The adjustment procedure suggests that, because measurement errors give rise to spurious transitions between labor market states, conventional measures may understate the duration of unemployment by as much as 80 percent, and overstate the frequency of labor force entry and exit by even more. *Econometrica*, Nov. 1986, 54(6), pp. 319-38. Massachusetts Institute of Technology; Harvard University.

#### 820 LABOR MARKETS; PUBLIC POLICY

##### 821 Labor Economics

Albrecht, James and Jovanovic, Boyan—The Efficiency of Search under Competition and Monopsony

This paper compares monopsonistic and competitive search equilibria. While the competitive equilibrium is efficient, the monopsonistic equilibrium is not: there is too much search, and the employment rate is too low. *J. Polit. Econ.*, Dec. 1986, 94(6), pp. 1246-57. New York University.

Bewley, Truman—The Share Economy in General Equilibrium

Martin Weitzman's 1982 paper on increasing returns and unemployment equilibrium is driven by the presence of a Clower constraint and does not provide a persuasive model of unemployment. The employment effects of implementation of a share economy are impossible to evaluate until unemployment equilibrium is understood. Further, the determination and adjustment of the share parameter and of labor demand are unsatisfactory in Weitzman's model. *J. Compar. Econ.*, Dec. 1986, 10(4), pp. 457-59. Yale University.

Blair, Christine E. and Rodrigues, Anthony P.—A Model of Wage Contract Bargaining with Imperfect Information and Strikes

The authors examine a model of wage bargaining based on optimizing behavior and imperfect information. In the model negotiation is used to extract private information. The model makes detailed predictions about the effects of various costs on the length of negotiations. Strikes or lockouts can be rational behavior either if the costs of negotiating are low or if the return to information is high. *Eastern Econ. J.*, July-Sept. 1986, 12(3), pp. 251-56. Federal Deposit Insurance Corporation, Washington, D.C.; Fordham University.

Blundell, Richard and Walker, Ian—A Life-Cycle Consistent Empirical Model of Family Labour Supply Using Cross-Section Data

This paper estimates a utility maximizing model of the joint determination of male and female labor supplies using a sample of married couples from the U.K. Family Expenditure

Survey. The emphasis is on the estimation of within-period preferences that are consistent with intertemporal, two-stage budgeting under uncertainty. However, the approach provides an alternative method of estimating certain aspects of life-cycle behavior to the fixed effects  $\lambda$ -constant approach of J. J. Heckman and T. E. MaCurdy (1980), MaCurdy (1981) and M. J. Browning, A. S. Deaton and M. Irish (1985). Moreover, it relaxes some of the underlying restrictions implicit in  $\lambda$ -constant models under uncertainty. *Rev. Econ. Stud.*, Aug. 1986, 53(4), pp. 539-58. University College, London; University of Manchester.

**Burtless, Gary**—Social Security, Unanticipated Benefit Increases, and the Timing of Retirement

This paper proposes a model of retirement behavior in which workers respond differently, although in a theoretically consistent manner, to the anticipated and unanticipated components of the social security benefit they can receive upon retirement. The retirement age decision in the presence of unanticipated benefit changes is shown to be a special case of utility maximization under a nonlinear budget constraint. The model is estimated using the Longitudinal Retirement History Survey. *Rev. Econ. Stud.*, Oct. 1986, 53(5), pp. 781-805. Brookings Institution.

**Connolly, Rachel**—A Framework for Analyzing the Impact of Cohort Size on Education and Labor Earning

This paper analyzes three models of labor demand solving for the change in wages of a given labor group due to a change in the size of a birth cohort. When the production function includes age-schooling groups as separate factors, an increase in the size of one birth cohort changes the size of several labor market groups. Also, in this case, the demand effect of changing factor size is joined by a supply effect of changing schooling proportions. Ignoring the supply effect may cause overestimation of the effect of a large birth cohort on wages of young skilled workers. *J. Human Res.*, Fall 1986, 21(4), pp. 543-62. Bowdoin College.

**Cooper, Russell**—Share Contracts and Macroeconomic Externalities

Martin Weitzman's analysis of the share economy contrasts fixed-wage and fixed-share contracts; this paper notes that neither is an optimal labor contract, rendering the comparison suspect. Given this comparison, though, share contracts may be superior to wage contracts in an economy characterized by a "macroeconomic externality," whereby firm-level employment decisions affect the demand for other firms' goods. *J. Compar. Econ.*, Dec. 1986, 10(4), pp. 421-26. University of Iowa.

**Dasgupta, Partha and Ray, Debraj**—Inequality as a Determinant of Malnutrition and Unemployment: Theory

This paper presents a theory that links involuntary unemployment to the incidence of malnourishment, relates them in turn to the production and distribution of income and, thus, ultimately to the distribution of assets. The model used to illustrate the theory is "general equilibrium." It is shown, among other things, that if aggregate assets in an economy are neither large nor small, and if the distribution of assets is highly unequal among people, then it is the assetless who are vulnerable in the labor market; specifically, there is involuntary unemployment among the assetless. *Econ. J.*, Dec. 1986, 96(384), pp. 1011-34. University of Cambridge; Indian Statistical Institute, Delhi and Stanford University.

**Ham, John C.**—Testing Whether Unemployment Represents Intertemporal Labour Supply Behavior

In this paper the author implements a misspecification test of the Lucas-Rapping treatment of unemployment as labor supply behavior using panel data. This test extends previous such work with micro data by simultaneously allowing for intertemporal substitution, uncertainty and endogenous unemployment. Strong evidence against the standard specification of intertemporal labor supply behavior is found. *Rev. Econ. Stud.*, Aug. 1986, 53(4), pp. 559-78. University of Toronto and Princeton University.

**Hoel, Michael and Vale, Ben**—Effects on Unemployment of Reduced Working Time in an Economy Where Firms Set Wages

The paper considers an economy where firms set wages, balancing the direct benefit of low wages with the indirect cost of low wages (relative to other firms) leading to high quit rates and, therefore, high training costs. Reducing the institutionally given working time makes the importance of training costs increase, thus making firms more concerned about keeping quit rates low. The effect is increased unemployment as a consequence of reduced working time. The effect on hourly and yearly wages is uncertain, although increased hourly wages seem to be the most plausible case. *Europ. Econ. Rev.*, Oct. 1986, 30(5), pp. 1097-1104. University of Oslo.

Luang, Wei-Chiao and Ray, Subhash C.—Labor Supply, Voluntary Work, and Charitable Contributions in a Model of Utility Maximization

This paper explores the interrelationship between charitable giving, volunteer work, and labor supply decisions. A theoretical model is presented where an individual's decisions relating to charitable giving, voluntary work, labor supply, and consumption are derived from maximizing a Stone-Geary utility function subject to time and budget constraints. Within this framework, the authors also analyze the impacts of changes in the wage and tax rates on labor supply and charitable behavior. The comparative static analysis yields some interesting results. *Eastern Econ. J.*, July-Sept. 1986, 12(3), pp. 257-63. Western Michigan University; University of Connecticut.

McKinson, T. J.—Testing Neo-classical Theories of Labour Demand: An Application of Cointegration Techniques

Neoclassical labor demand theories are tested on U.K. time-series data using cointegration techniques. The two alternative approaches of the "cointegrating regression" and the "error-correcting mechanism" are presented, neither of which supports the existence of a simple neoclassical equilibrium labor demand relationship. Some caution should, however, be exercised in practical applications of cointegration, due to the lack of power of existing tests of cointegration and cointegration against certain nonstationary autoregressive structures. *Oxford*

*Bull. Econ. Statist.*, Aug. 1986, 48(3), pp. 241-51. Merton College, Oxford University.

Kaiser, Carl P.—Unemployment Insurance and the Theory of Labor Demand

This paper models the effects of unemployment insurance (UI) on firm behavior in an environment of fluctuating product demand. Given certain assumptions regarding the firm, the model implies that stronger experience rating of the UI tax will increase layoff costs and so: (1) dampen fluctuations in the quantities of worker hours and the employment stock demanded by the firm; (2) reduce layoffs; and (3) increase the ratio of average hours per worker to the employment stock in all periods. A higher UI benefit rate will increase layoff costs for employers who face strong experience rating and incur low hiring costs, and decrease layoff costs for employers for whom experience rating is weak and hiring costs are high. Thus, in the aggregate, a higher benefit rate is not likely to have substantial effects on the employment and hours decisions made by firms. *Eastern Econ. J.*, Apr.-June 1986, 12(2), pp. 115-28. Washington and Lee University.

Kato, Takao—"Bumping," Layoffs, and Work-sharing

This paper deals with an interesting but often-neglected labor practice prevalent in large North American firms with well-developed internal labor markets. Large North American firms typically respond to a decline in demand for their products by first reducing the number of hours worked (or worksharing). As the demand continues to fall, however, they begin to make skilled workers "bump onto" unskilled jobs, displacing unskilled workers. Skilled workers are laid off only after a considerable number have bumped. The author develops an implicit contract model and explains the practice. *Econ. Inquiry*, Oct. 1986, 24(4), pp. 657-68. Colgate University.

Katz, Eliakim; Spiegel, Uriel and Ziderman, Adrian—The Remuneration Package and Pareto Inefficiency in the Labour Market

This paper argues that a simple wage payment system relating wages to hours of work supplied cannot bring about Pareto efficiency

in the labor market and that in its search for efficiency, the labor market has evolved an alternative pricing system that differs from those generally found in other markets. Specifically, it is demonstrated that whereas Pareto efficiency will in general be absent in the labor market when a single price system prevails, a labor reward package consisting both of a fixed payment element unrelated to hours of work supplied and a work input related wage element is likely to bring about Pareto efficiency. *Europ. Econ. Rev.*, Dec. 1986, 30(6), pp. 1197-1205. Bar-Ilan University, Ramat Gan, Israel and York University, Ontario, Canada; Bar-Ilan University and University of Pennsylvania; Bar-Ilan University and University of British Columbia.

Lockwood, Ben—Transferable Skills, Job Matching, and the Inefficiency of the 'Natural' Rate of Unemployment

Two things are accomplished in this paper. First, the author has shown that search equilibrium may be inefficient even in the absence of external effects that work through the matching probabilities. Second, policies that might counteract these external effects are considered. Apart from policies that directly increase worker bargaining power, it is seen that a wage tax or a profit tax combined with an employment subsidy improves efficiency, but that a profit tax alone may reduce it. *Econ. J.*, Dec. 1986, 96(384), pp. 961-74. Birkbeck College, London.

Miyazaki, Hajime—Labor-Management Bargaining: Contract Curves and Slutsky Equations

Consider a firm in which labor and management bargain over division of the firm's organizational rent and negotiate the firm's policy. The author emphasizes the relationship between the bargainer's contract curve and the firm's Slutsky equations. A bargaining firm is described as a hybrid of a profit-maximizing firm and a labor-managed firm. The methodology is applied to models of employment contracts under three separate circumstances in which labor's bargaining power affects the firm's comparative-static behavior are identified: (1) inefficiency in the bargained contract; (2) the interac-

tion between workers' income effects and the firm's capital cost burden; and (3) incompleteness of the market for property rights in the firm. *J. Polit. Econ.*, Dec. 1986, 94(6), pp. 1225-45. Ohio State University.

Mookherjee, Dilip—Involuntary Unemployment and Worker Moral Hazard

This paper critically examines the hypothesis that layoffs are involuntary in implicit labor contracts because they are used by employers to punish inferior worker performance. In repeated moral hazard situations, workers typically bear risk associated with whether they are chosen to be laid off even though the latter is uninformative about previous effort choices and wages are performance-contingent. However the hypothesis is unsatisfactory as optimal contracts involve involuntary retentions rather than involuntary layoffs in a wide variety of circumstances. *Rev. Econ. Stud.*, Oct. 1986, 53(5), pp. 739-54. Stanford University.

Murphy, Kevin J.—Incentives, Learning, and Compensation: A Theoretical and Empirical Investigation of Managerial Labor Contracts

This article analyzes properties and implications of multiperiod managerial labor contracts under two alternative hypotheses: *incentives*, in which productivity depends on unobservable effort, and *learning*, in which ability is unknown and is revealed over time. Shared and conflicting implications of these competing models are developed in terms of experience-earnings profiles and the relation between compensation and performance. The author empirically examines these theoretical results by using a longitudinal sample of 1,488 chief executive officers followed from 1974-85. The data yield mixed evidence that generally supports the learning hypothesis over the incentive hypothesis. *Rand J. Econ.*, Spring 1986, 17(1), pp. 59-76. University of Rochester.

Fyatt, Graham—Inertia in Labor Markets

The paper generalizes I. M. MacDonald and R. M. Solow's treatment of wages and employment determination as a cooperative game between a firm and a firm-specific union. Pareto-efficient solutions are derived for the case when

recruitment of nonunion labor is allowed. These show that employment can be insensitive to small changes in product demand; that the wage may be either more or less than the marginal venue product of labor; and that the firm may choose to operate in an x-inefficient manner.

reinterpretation of the model relates these results to the work of W. Y. Oi on labor as a quasi-fixed factor. *Eastern Econ. J.*, July-Sept. 1986, 12(3), pp. 243-50. University of Warwick.

Caprio, Carl—Investment, Moral Hazard, and Occupational Licensing

The author analyzes occupational licensing as an input regulation that requires minimum level of human capital investment by professionals. By raising professionals' training levels, licensing helps alleviate moral hazard problems associated with the provision of high quality services. It is shown that licensing and certification, whereby consumers are provided information about professionals, tend to benefit consumers who value quality at the expense of those who do not. Licensing may raise total surplus if sellers' investments are not observable, but is Pareto-worsening if training levels are observable. Certification may, however, lead to excessive investment as a signaling device. *Rev. Econ. Stud.*, Oct. 1986, 53(5), pp. 3-62. Princeton University.

vojnar, Jan—Bargaining Power, Fear of Disagreement, and Wage Settlements: Theory and Evidence from U.S. Industry

The paper develops and estimates a theoretical model of wage determination and union-nonunion wage differentials. It generalizes the Nash-Zeuthen-Harsanyi bargaining model by making the solution to the institutional concepts of bargaining power and fear or cost of disagreement and by making the outcome depend not only on endogenous but also on exogenous factors. Estimates based on twelve companies and unions indicate that the bargaining outcome often deviates from the Nash-Zeuthen-Harsanyi solution and that it varies significantly with exogenous factors. Estimates from most firms also support the efficient labor contract rather than marginal productivity theory. *Econometrica*, Sept. 1986, 54(5), pp. 1055-78. Cornell University.

Tobin, James—Inflation and Unemployment in the Share Economy

This paper first interprets Martin Weitzman's monopolistic competition analogy to the share economy, and notes the implications of this for the nature of "excess demand" in such an economy. The paper then focuses on the effects of the wage flexibility induced by sharing schemes. It is observed that Weitzman's analysis is entirely in terms of real, not nominal, variables. The paper concludes with a note on possible distributional conflicts in a share economy. *J. Compar. Econ.*, Dec. 1986, 10(4), pp. 460-63. Yale University.

## 822 Public Policy; Role of Government

Calcoen, F.; Eeckhoudt, L. and Outreville, J. F.—Indemnisation du chômage et revenus de remplacement: Une approche par la théorie de l'assurance (Unemployment Insurance and Damage Insurance: An Approach through the Theory of Insurance)

In this paper, taking into consideration the point of view of the insured, the authors compare the properties of unemployment insurance to those of damage insurance. They start by studying the hypothetical case of an unemployment insurance fully supplied by the private sector. They then turn to the more realistic case where private contracts are complementary to a compulsory public system. The analysis stresses the specific properties of the demand for unemployment insurance. *Schweiz. Z. Volkswirtschaft. Statist.*, Sept. 1986, 122(3), pp. 323-37 (French). Centre de Recherches Economiques, Sociologiques et de Gestion, France; Faculté universitaire catholique de Mons, Belgium; University of Laval, Quebec.

Deakin, Simon—Labour Law and the Developing Employment Relationship in the UK

The movement toward a dual system of employment protection in labor law and collective bargaining has created the conditions for a polarization of the employment structure and a widening division between core and marginal groups in the labor force. The absence of institutional protection for marginal workers accelerated the growth in atypical and low-paid employment even prior to the impact upon the labor market of policies of deregulation. Analy-

sis shows that legal evolution has been both a cause of, and a response to, changes in the social and economic structure of employment. *Cambridge J. Econ.*, Sept. 1986, 10(3), pp. 225-46. University of Cambridge.

**Jones, Stephen R. G.—Unemployment Insurance and Involuntary Unemployment: The Case of Adverse Selection**

The paper studies the private and public provision of unemployment insurance in a model where equilibrium unemployment results from the use of the wage as a worker selection device. It is shown that private provision will not occur, essentially because those workers most desired by a firm place least value on such coverage. Respecting the same informational constraints, public provision necessarily gives rise to some distortions in participation decisions, but nonetheless is welfare improving in the aggregate. *J. Public Econ.*, Aug. 1986, 30(3), pp. 317-28. University of British Columbia and Institute for Advanced Study, Princeton.

**Kerns, Wilmer L.—Federal Employees' Retirement System Act of 1986**

This article describes the provisions of the Federal Employees' Retirement System (FERS) for employees hired after December 31, 1983, including survivor annuities and disability benefits. It also explains how employees covered under the Civil Service Retirement System may freeze their earned benefits under that program and transfer to FERS during July-December 1987. The new system, which goes into effect on January 1, 1987, features a defined-benefit retirement plan to augment mandatory coverage under social security. It also permits FERS participants to contribute up to 10 percent of their earnings, on a tax-deferred basis, to a thrift savings plan, with partial matching by the government. *Soc. Sec. Bull.*, Nov. 1986, 49(11), pp. 5-10. Social Security Administration.

**Wright, Randall—The Redistributive Roles of Unemployment Insurance and the Dynamics of Voting**

Public unemployment insurance is analyzed as the majority voting equilibrium policy of a

dynamic stochastic economy. Abstracting from incentive effects, the author focuses on redistribution. Some results are: because of the distribution of heterogeneous employment opportunities, public insurance may be democratically chosen even if complete private markets exist. Because of the dynamics, even when agents are intrinsically homogeneous the equilibrium benefit level (or duration-benefit schedule) deviates from what has been described as optimal in the literature. The effects of differences in the average frequency or duration of unemployment on equilibrium taxes and benefits are investigated, with some unanticipated results. *Public Econ.*, Dec. 1986, 31(3), pp. 377-94. Cornell University.

**823 Labor Mobility: National and International Migration**

**Borjas, George J.—The Self-Employment Experience of Immigrants**

Self-employment is an important aspect of the immigrant experience in the labor market. Self-employment rates from immigrants exceed 15 percent for some national groups. Using the 1970 and 1980 U.S. Censuses, this analysis shows that self-employment rates of immigrants exceed those of native-born men; that there is a strong, positive impact of assimilation on self-employment rates; that more recent waves of immigrants are opting with increasing frequency for the self-employment option; and that part of the immigrant/native-born differential in self-employment rates can be attributed to "enclave" effects. *J. Hum. Res.*, Fall 1986, 21(4), pp. 485-506. University of California, Santa Barbara.

**Goss, Ernst P. and Paul, Chris—Age and Work Experience in the Decision to Migrate**

This study concludes that past migration research studies, by failing to control for years of work experience, have computed a coefficient for the age variable that is the summation of two oppositely signed factors. While age increases the psychic cost of moving and increases the length of the accrual period for benefits, thus inhibiting geographic mobility, it also increases the general skill level thus stimulating geographic mobility. By controlling for years of experience, this study more accurately

measures the impact of age on the migration decision and introduces a modification to the standard human capital model as presented in migration literature. *J. Human Res.*, Summer 1986, 21(3), pp. 397-405. University of Alabama.

**folho, Ian—Theories of Migration: A Review**

This paper sets out to review developments in the theory of labor migration. Key themes identified in the analysis relate to imperfect information and search, contracted versus speculative migration, the treatment of space and distance deterrence, the impact of demand side processes on the choice set faced by individuals, the interaction between preferences and constraints on the supply side, underlying motivations for movement, temporal dimensions, and problems in aggregation. With these themes in mind, the development of migration theory is traced from early classical perspectives through to the Harris-Todaro model, the human capital approach, stress models, random utility perspectives, and search theory. *Scot. Polit. Econ.*, Nov. 1986, 33(4), pp. 396-419. University of Newcastle upon Tyne.

**24 Labor Market Studies, Wages, Employment**

**Andersen, P. S.—Keynesian and Classical Unemployment: Evidence from the Current Cycle**

The paper attempts to explain the different labor market trends in North America and Europe. Using a model that integrates labor demand with the process of inflation, empirical estimates are made for the United States, West Germany, the United Kingdom and Belgium. The main conclusions are that in all four countries the recent changes in employment and unemployment have mainly been the result of real output developments. However, real wages have had a more unfavorable effect on employment and unemployment in Europe than in the United States. Moreover, the scope for a sustainable reduction of unemployment in the three European countries is limited by high real wages and/or a procyclical real wage behavior. *Eastern Econ. J.*, July-Sept. 1986, 2(3), pp. 223-36. Bank of International Settlements, Basle.

**Barro, John M. and Loewenstein, Mark A.—On Imperfect Evaluation and Earning Differentials**

This paper investigates the relationship between the technology for evaluating performance and optimal contract choice. Specifically, the paper examines the different compensation packages that arise when occupations differ in evaluation technology, workers are risk averse, work effort is endogenous, and there exists asymmetric information. In occupations in which it is less difficult to measure output, it is shown that compensation is more closely tied to output; the implications for work effort, the sorting of workers by ability, and average compensation are developed. Analysis of a new data set confirms the authors' predictions concerning earning differentials and wage growth. *Econ. Inquiry*, Oct. 1986, 24(4), pp. 595-614. Purdue University; Virginia Polytechnic Institute and State University.

**Flaim, Paul O.—Work Schedules of Americans: An Overview of New Findings**

This article represents an introduction to eight articles in the *Review* that discuss in detail, on a topic-by-topic basis, the time Americans spend working. The new information, not previously studied at the national level, was collected in May 1985 through a special supplement to the Current Population Survey. Data are provided on such topics as multiple jobholders, Saturday work and Sunday work, work outside typical daylight hours—usually in the evening, home-based work of at least eight hours a week, flexitime, preference for longer work weeks (and thus, more money) versus shorter work hours (and reduced earnings), and temporary help workers. *Mon. Lab. Rev.*, Nov. 1986, 109(11), pp. 3-6. Bureau of Labor Statistics.

**Flinn, Christopher J.—Econometric Analysis of CPS-Type Unemployment Data**

Analysts studying the unemployment experiences of population members often have access to data collected from a sample of individuals that contain the length of the ongoing spells of unemployment for sample members currently unemployed. No information regarding the lengths of ongoing employment spells is collected. This paper considers how such infor-

ration may be utilized in the estimation of parameters of alternating renewal process models of labor market attachment, in the presence of both observed and unobserved population heterogeneity. A number of models are presented, and estimation is carried out using a CPS-type data set from Italy. *J. Human Res.*, Fall 1986, 21(4), pp. 456-84. University of Wisconsin, Madison.

**Heckman, James J. and Hotz, V. Joseph**—An Investigation of the Labor Market Earnings of Panamanian Males: Evaluating the Sources of Inequality

This paper presents empirical evidence on the determinants of labor market earnings and inequality for males in Panama. Using newly available microdata, it estimates earnings equations based on Jacob Mincer's measurement framework and compares them with those for other countries at various stages of economic development. It presents evidence on two aspects of inequality in less-developed economies: labor market segmentation and social stratification. It presents tests of the segmentation hypothesis, including several of the dual labor market hypotheses, and discusses their inherent ambiguity. It also presents evidence on the importance of family background for earnings determination and educational attainment. *J. Human Res.*, Fall 1986, 21(4), pp. 507-42. University of Chicago.

**Horvath, Francis W.**—Work at Home: New Findings from the Current Population Survey

In May 1985, the Bureau of Labor Statistics made its first attempt to determine the size of the home-base work force. "Work at home" is defined as only that which is done as part, or as an extension, of one's primary job. While more than an estimated eighteen million people responded affirmatively to the question regarding work at home, almost half of them worked at home for less than eight hours a week. Another 770,000 were farmers or farm laborers. The remainder, nearly 8.4 million persons, had worked at home for eight hours or more in the reference week. They are the focus of this article's analysis. *Mon. Lab. Rev.*, Nov. 1986, 109(11), pp. 31-35. Bureau of Labor Statistics.

**Lovell, Michael C.**—A Quick Fix for the Unemployment Estimate

The seasonally adjusted unemployment estimates released on the first Friday of each month are shown to be subject to substantial revision error. This paper finds that a "rational expectations" approach to the problem provides a "Quick Fix" strategy that reduces the size of revision errors and smooths out much of the bogus bounce in the estimated month-to-month change in the unemployment estimates. A considerable gain in accuracy can be achieved by reducing the initially reported change in the seasonally adjusted unemployment rate by a factor of one-third. *Brookings Pap. Econ. Act.*, 1986, (2), pp. 520-32. Wesleyan University.

**Moulton, Brent R.**—Human Capital Accumulation and Trends in the Male-Female Wage Gap in the United States, 1956-1983

This paper considers the importance of components of human capital, i.e., education, experience, and on-the-job training, to explaining changes over time in the male-female wage gap in the United States. Special emphasis is given to measuring actual labor market experience of the female work force. A new relative quality index is created and its changes over time are found to be closely related to changes in relative wages over this period. *Eastern Econ. J.*, July-Sept. 1986, 12(3), pp. 265-71. U.S. Bureau of Labor Statistics.

**Peck, Merton J.**—Is Japan Really a Share Economy?

Martin Weitzman claims that Japan is a "living laboratory" for the share economy. This paper examines that proposition and concludes that Japanese bonuses are better interpreted as disguised wage payments than as profit shares. Other institutional features of the Japanese labor market provide more likely explanations of that economy's performance. *J. Compar. Econ.*, Dec. 1986, 10(4), pp. 427-32. Yale University.

**Pozo, Susan and Woodbury, Stephen A.**—Pensions, Social Security, and Asset Accumulation

In this paper, the authors use a sample of households from the 1983 Survey of Consumer

Finances to examine the influences of private pensions and Social Security on two variables: the age of planned retirement and nonretirement asset holdings. The results are consistent with the idea that increased private pension wealth induces both earlier planned retirement and greater nonretirement asset holdings (presumably to finance the anticipated longer retirement period). Further, the findings suggest that greater Social Security wealth may induce slightly earlier planned retirement, but has little influence on nonretirement asset accumulation. *Eastern Econ. J.*, July-Sept. 1986, 12(3), pp. 273-81. Western Michigan University; Michigan State University.

Sickles, Robin C. and Taubman, Paul—An Analysis of the Health and Retirement Status of the Elderly

This study uses five biennial panels of males in the Retirement History Survey to estimate a model of self-assessed health status and retirement status. Both are categorical dependent variables, which may be jointly determined. Heterogeneity among different individuals is controlled for using random effects. The authors outline Gaussian quadrature formulae to calculate and individual's contribution to the likelihood function, which involves ten-way integration of the normal density function. The results indicate that there is a trade-off between Social Security benefits and wages, and that there is a sharp decline in retirement before age sixty-two, the earliest date nondisabled men are eligible for benefits, suggesting substantial imperfections in capital markets. *Econometrica*, Nov. 1986, 54(6), pp. 1339-56. Rice University; University of Pennsylvania.

Simpson, Wayne—Analysis of Part-Time Pay in Canada

This paper analyzes the differences between part-time and full-time wages in Canada using the 1981 Survey of Work History. Since part-time and full-time workers are distinguished by hours worked, and since hours worked and wages are interdependent, selectivity bias occurs if ordinary least squares regression is used. A modification of Heckman's procedure, to account for the fact that part-time hours are doubly truncated, is used to correct this problem.

The results indicate that, adjusting for differences in characteristics, the wage differential between part-time and full-time workers is 10 percent, or one-third the unadjusted differential. Results vary somewhat by sex and marital status. *Can. J. Econ.*, Nov. 1986, 19(4), pp. 796-807. University of Manitoba, Winnipeg.

Stinson, John F., Jr.—Moonlighting by Women Jumped to Record Highs

New information collected in May 1985 through a special supplement to the *Current Population Survey* reveals a particularly sharp increase in the number of women with two jobs—by almost 40 percent between 1980 and 1985. This is another sign of the growing strength of their ties to the job market. Nearly 5 percent of working women are now multiple jobholders. The rate for men continued to hold steady at 5.9 percent. Data are presented by reasons for moonlighting, demographic characteristics, industry, hours of work, and earnings. Also provided are data from May 1970 to May 1985 for selected characteristics of multiple jobholders. *Mon. Lab. Rev.*, Nov. 1986, 109(11), pp. 22-25. Bureau of Labor Statistics.

Stobernack, Michael—Umfang und Struktur der stillen Reserve auf dem Arbeitsmarkt. Eine Schätzung auf der Grundlage des Sozioökonomischen Panels (Size and Structure of Hidden Unemployment in the Federal Republic of Germany.)

Due to the phenomenon of hidden unemployment, the validity of the German rate of unemployment as indicator for the imbalance of the labor market is limited. There are two possible solutions for calculation of hidden unemployment: modeling and survey. An example of each method is analyzed. Seventeen different estimates of hidden unemployment are resumed. The author's estimate is based on a representative survey, carried out in 1984 with 5,980 households including 12,358 persons. Hidden unemployment has been quantified as at least 760,000 in 1984. The structure shows that hidden unemployment is mostly formed of women, young people, and chronically unemployed. *Kölner Zeitschrift für Soziologie und Sozialpsychologie*, 1986, 32(4), pp. 195-217 (German). Technical University, Berlin.

**Williams, Donald R. and Register, Charles A.**—Regional Variations in Earnings and the Gender Composition of Employment: Is "Women's Work" Undervalued?

In this study the authors attempt to determine whether the work of females is "undervalued" or "low valued," by testing the hypothesis that earnings in an occupation are related to the gender composition of employment in the occupation. The authors examine earnings variations within given occupations (across regions) so that across-occupation variations in the value of output can be controlled. The results, using aggregate data from the 1980 census for a cross section of fifty Standard Metropolitan Statistical Areas (SMSAs) support the hypothesis that women's work is undervalued in at least four of the eight occupations studied. *J. Econ. Issues*, Dec. 1986, 20(4), pp. 1121-34. Kent State University.

**825 Productivity Studies: Labor, Capital, and Total Factor**

**Barbera, Anthony J. and McConnell, Virginia D.**—Effects of Pollution Control on Industry Productivity: A Factor Demand Approach

Four major manufacturing industries are examined. The abatement effect on capital and labor productivity is determined from parameters of a system of factor demand equations that allow for disequilibrium in factor markets. The system is estimated for each industry with annual time series data from 1960 to 1980. Abatement requirements were found to retard both average capital productivity and average labor productivity in three of the four industries: paper, chemicals, and primary metals. For several industries in which factor productivity was slower after 1973, environmental controls accounted for a significant proportion of that slow down. *J. Ind. Econ.*, Dec. 1986, 35(2), pp. 161-72. University of Maryland, College Park; University of Maryland, Baltimore.

**Halten, Charles R.**—Productivity Change, Capacity Utilization, and the Sources of Efficiency Growth

The main result of the paper is that the growth rate of real short-run average cost can be decomposed into two terms: the growth rate of multi-factor productivity and the Berndt-

Fuss capacity utilization effect. This decomposition can be carried out using prices and quantities alone without resorting to the econometric estimation of the parameters of the production function. A second result explores the relationship between the true multi-factor productivity residual, real short-run unit cost, and the "false" multi-factor productivity residual obtained by erroneously assuming that all factors are fully flexible. It is shown that the growth rate of real short-run average cost equals the growth rate of the false residual, and that the false and true residuals differ by the Berndt-Fuss capacity utilization effect. *J. Econometrics*, Oct./Nov. 1986, 33(1/2), pp. 31-50. National Bureau of Economic Research and University of Maryland.

**Mark, Jerome A.**—Problems Encountered in Measuring Single- and Multifactor Productivity

This article discusses some of the problems the Bureau of Labor Statistics has encountered in developing productivity measures and explains the approaches taken to solve them. Despite recent progress, it is clear that inadequacies remain in the data available for measurement of both labor and multifactor productivity. In addition, multifactor productivity measurement presents challenging problems of shaping sometimes imperfect data into empirical measures that take advantage of recent theoretical advances. While they are useful for understanding factors affecting the traditional productivity movements, and many such measures have been developed, it is important to recognize that they do not have the same degree of precision that the labor productivity measures have. *Mon. Lab. Rev.*, Dec. 1986, 109(12), pp. 3-11. Bureau of Labor Statistics.

**Neef, Arthur**—International Trends in Productivity and Unit Labor Costs in Manufacturing

This article examines comparative annual average percent changes in manufacturing labor productivity and labor costs through 1985 in the United States and eleven other industrial nations. The comparisons are limited to trend measures only; reliable level comparisons of

manufacturing productivity and unit labor costs are not available. The measures for 1985 are preliminary. Data for other years are also subject to some revision. The article also provides comparisons of changes in U.S. manufacturing productivity and labor costs relative to a trade-weighted average of the eleven other countries. The weights used to combine the other eleven countries indexes into an average "competitors" index reflect the relative importance of each country as a manufacturing trade competitor as of 1980. *Mon. Lab. Rev.*, Dec. 1986, 109(12), pp. 12-17. Bureau of Labor Statistics.

### 830 TRADE UNIONS; COLLECTIVE BARGAINING; LABOR-MANAGEMENT RELATIONS

#### 831 Trade Unions

Eberts, Randall W. and Stone, Joe A.—Teacher Unions and the Cost of Public Education

Do teacher unions affect the cost of public education? Based upon data from two national surveys, and holding measures of educational output and other factors constant, the authors of this paper find that teacher unions raise costs by 7 to 15 percent. The estimated differential is not reduced by treating unionization as endogenous, by distinguishing between large and small districts, or by distinguishing between districts in large and small cities. The union effect on cost works through teacher compensation, production technology, and factor use, and is borne primarily by taxpayers, with little or no effect on average student achievement. *Econ. Inquiry*, Oct. 1986, 24(4), pp. 631-43. University of Oregon.

White, Michael D.—Self-Interest Redistribution and the National Football League Players Association

The NFL Players Association's decision to seek increased collective determination of player compensation through a salary schedule in 1982 is explained in this study as being motivated by self-interest redistribution. Probit and multiple regression analysis are used to test whether the redistribution is consistent with median voter self-interest redistribution. The results indicate substantial redistribution in favor of the median voter with respect to experience. The Players Association's actions, which have been

criticized as being against the players' interests, appear consistent with the interests of a majority of the players. *Econ. Inquiry*, Oct. 1986, 24(4), pp. 669-80. St. Cloud State University, Minnesota.

#### 832 Collective Bargaining

Tracy, Joseph—Unions and the Share Economy

This paper contrasts share bargaining and wage bargaining in the context of a "monopoly" model of union bargaining. In the example considered here, employment levels are identical under wage and share systems, but total compensation is higher under share bargaining than under wage bargaining, underscoring the importance of the broader context within which a share system is introduced. *J. Compar. Econ.*, Dec. 1986, 10(4), pp. 433-37. Yale University.

#### 833 Labor-Management Relations

FitzRoy, Felix R. and Kraft, Cornelius—Profitability and Profit-Sharing

Claims that profit-sharing is a purely distributive "wealth confiscation scheme" without incentive effects (due to free-rider problems) are based on neglect of cooperation and interaction in the workforce. When these activities are difficult to monitor directly, group incentives such as profit-sharing can increase efficiency and maintain a superior Nash equilibrium with strictly individual optimization. With simultaneous WLS-Tobit estimates the authors find here strong effects of profit-sharing and worker ownership shares on residual owners' return on capital in medium-sized metal working firms in West Germany, complementing earlier results on productivity. *J. Ind. Econ.*, Dec. 1986, 35(2), pp. 113-30. International Institute of Management, Berlin.

### 840 DEMOGRAPHIC ECONOMICS

#### 841 Demographic Economics

Cigno, Alessandro—Fertility and the Tax-Benefit System: A Reconsideration of the Theory of Family Taxation

This paper examines the implications of endogenous fertility (parental control over number of births) for the design of the tax-benefit system. The results obtained under the assumption of endogenous fertility differ considerably

from those obtained under the opposite assumption and from popular belief. In particular, it is shown that, if fertility is endogenous, a rise in the rate of child benefits would reduce the amount of resources (including parental time) spent on each child and, furthermore, that higher child benefits are not, in general, optimally associated with greater social preference for equality. Similar results apply to the taxation of earnings and bequests. *Econ. J.*, Dec. 1986, 96(384), pp. 1035-51. University of Hull, England.

Grossbard-Shechtman, Amyra—Economic Behavior, Marriage and Fertility: Two Lessons from Polygyny

This paper derives and estimates an index of the relative importance of children in marriage by comparing the effect of husband's income on the actual number of wives in the household with the demand for wives derived from the number of children in the household. Moreover, the paper presents the monogamy bias as a possible explanation for often observed low or negative-income effects on fertility. *J. Econ. Behav. Organ.*, Dec. 1986, 7(4), pp. 415-24. San Diego State University and Bar-Ilan University, Ramat-Gan, Israel.

Lessibile, Gérard—L'influence des événements familiaux dans la formation des revenus (The Effect of Family Events on Earnings)

By decomposing the professional experience of males and females as a function of major family events, an attempt is made to relate the advantage of marital union to the education level of the individual. The chosen approach analyzes as well the role of fecundity, doing so by isolating the effect of spacing of births and age at the first born on the salary profile. *Ann. Econ. Statist.*, Apr./June 1986, (2), pp. 101-16 (French). Institut de Recherche sur l'Economie de l'Éducation.

## 830 HUMAN CAPITAL; VALUE OF HUMAN LIFE

### 831 Human Capital; Value of Human Life

Fracharopoulos, George and Arriagada, Ana Maria—The Educational Composition of the Labour Force: An International Comparison

The most commonly used indicator of human resource development—enrollment ratios in the different levels of schooling—suffers from a number of defects, and the authors argue that a more accurate indicator is the educational attainment of the labor force. Relevant data have been collected for nearly 100 countries and are summarized into regional indices. Statistics on the mean years of schooling embodied in the labor force show significant differences in the human capital stock between world regions, as well as between countries within a given region. Such differences could be used to explain variations in economic growth patterns, or to assess relative priorities in educational investment. *Int. Lab. Rev.*, Sept.-Oct. 1986, 125(5), pp. 361-74. World Bank.

## 900 Welfare Programs; Consumer Economics; Urban and Regional Economics

### 910 WELFARE, HEALTH, AND EDUCATION

#### 911 General Welfare Programs

Wolf, Douglas and Greenberg, David—The Dynamics of Welfare Fraud: An Econometric Duration Model in Discrete Time

An important source of errors in transfer payments programs is the fraudulent misreporting of earnings received by recipients. A model is proposed of the recipient's decision to report income and the expected penalties if caught engaging in fraud. The paper discusses several features of the detection and penalty structures in the AFDC and Food Stamps programs and estimates a model of the duration of fraudulent earnings-misreporting episodes. It finds that recipients respond to increases in the returns to fraud by lengthening their episodes of misreporting. However, the level of fraudulent activity at any given time is rather low. *J. Human Res.*, Fall 1986, 21(4), pp. 437-55. International Institute for Applied Systems Analysis; University of Maryland.

#### 912 Economics of Education

Ramsey, Thomas Baldwin—Planning Education for Economic Progress: Distinguishing Occupational Demands from Technological Possibilities

Given rapid evolution of technology, this essay argues that educational planners can promote economic progress better by providing universally the skills necessary to master the best technology than by meeting demands of existing or predicted occupational structures. It shows how recent commissions—the Paideia Group, the National Commission on Excellence in Education, the Task Force on Education for Economic Growth, and the Committee for Economic Development—and two economists—Philip Foster and Marc Blaug—ignore or misunderstand the principle of technological determination, and how the Morrill Act of 1862 and the GI Bill of 1944 successfully conformed to that principle. *J. Econ. Issues*, Dec. 1986, 20(4), pp. 1053–65. Western State College, Gunnison, Colorado.

913 Economics of Health (including medical subsidy programs)

Deweese, Donald N. and Daniels, Ronald J.—  
The Cost of Protecting Occupational Health:  
The Asbestos Case

This paper estimates the cost of reducing the mortality risk from asbestos exposure. The authors use a dose-response model to predict cancer-related fatalities caused by exposure to asbestos. They then estimate the cost of controlling these exposures in the workplace and calculate the cost per life saved at different exposure levels. It is argued that current government regulation in the United States and Canada controlling the amount of asbestos to which a worker may be exposed yields a cost per life saved far in excess of the costs for occupational accidents. *J. Human Res.*, Summer 1986, 21(3), pp. 381–96. University of Toronto.

Ellis, Randall P. and McGuire, Thomas G.—  
Cost Sharing and Patterns of Mental Health  
Care Utilization

Deductibles and coverage ceilings are common features of health insurance. This paper proposes and tests a new method for estimating the impact of these health coverage features on demand when total demand during a particular period is not known with certainty at the beginning of the period. The authors use expected end-of-year price as a proxy for the notion of "effective price" first suggested by—

Keeler et al. in a two-stage estimation procedure. Applying the method to the demand for ceiling yields estimated demand responses similar to those obtained by other researchers. *J. Human Res.*, Summer 1986, 21(3), pp. 350–79. Boston University and Health Data Institute.

Ellis, Randall P. and McGuire, Thomas G.—  
Provider Behavior under Prospective Reimbursement: Cost Sharing and Supply

Prospective payment systems for health care constitute cost sharing on the margin for providers. A model of supply is developed showing that if physicians undervalue benefits to patients relative to hospital profits, prospective payment leads to too few services being provided. A "cost-based" system generally leads to an oversupply. The optimal payment system is derived in which the degree of supply-side cost sharing is considered a policy instrument. In most circumstances, the optimal payment system combines elements of both prospective and cost-based payment. This "mixed system" is shown to have desirable incentive and risk-reduction features. *J. Health Econ.*, June 1986, 5(2), pp. 129–51. Boston University.

Feldman, Roger and Dowd, Bryan—Is There  
a Competitive Market for Hospital Services?

This paper estimates the price elasticity of payer-specific hospital demand curves. Each hospital is assumed to price discriminate among patients covered by various payers. Two methods are used. First, a pricing rule is derived from which payer-specific price elasticities may be inferred. Using data from thirty-one hospitals in Minneapolis in 1981, this method shows that hospitals had monopoly power in their markets for several private health insurance plans. These results are confirmed and extended to Medicare patients by a second method, which examines the distribution of each payer's admissions to determine if low-priced hospitals attract more patients. *J. Health Econ.*, Sept. 1986, 5(3), pp. 277–92. University of Minnesota.

Frank, Richard G. and Lave, Judith R.—The  
Effect of Benefit Design on the Length of  
Stay of Medicaid Psychiatric Patients

This paper examines the factors affecting the length of stay of Medicaid psychiatric patients

with a model of supply responses to different patient, environmental, and regulatory characteristics. The results indicate that providers respond to limitations in both coverage and reimbursement. Treatment of psychiatric patients is found to respond strongly to financial incentives, suggesting that in any study of the length of stay of psychiatric patients, the structure of their insurance coverage must be considered. This finding makes it difficult to infer medically appropriate patterns of care from observed length-of-stay data. *J. Human Res.*, Summer 1986, 21(3), pp. 321-37. Johns Hopkins University; University of Pittsburgh.

Grannemann, Thomas W.; Brown, Randall S. and Pauly, Mark V.—Estimating Hospital Costs: A Multiple-Output Analysis

This study explores a new approach to estimating the cost of inpatient and outpatient services provided by hospitals. Data from a nationwide survey of nonfederal, short-term U.S. hospitals are used to make cost estimates based on a multiple-output cost function. The results provide information on the structure of hospital costs, and include estimates of the marginal and average incremental cost of outpatient care. Because of the innovative specification of the cost function, the study is of interest for its methodology as well as empirical results. *J. Health Econ.*, June 1986, 5(2), pp. 107-27. Mathematica Policy Research, Inc., Princeton; Mathematica Policy Research, Inc., Princeton; University of Pennsylvania.

Jensen, Gail A. and Morrissey, Michael A.—Medical Staff Specialty Mix and Hospital Production

The authors analyze the role of medical staff characteristics in determining aspects of hospital output. Using flexible functional form production functions, and adjusting for case mix, the output contribution of physicians and other inputs, and the influence that physicians in different specialties have on the productivity of other physicians as well as on other inputs are examined. Hospitals' input substitution possibilities are also examined and the estimates are compared to those obtained by other researchers. It is found that physicians are an important input having numerous effects and conclude

that they should not be ignored in empirical cost and production function studies for hospitals. *J. Health Econ.*, Sept. 1986, 5(3), pp. 253-76. Hospital Research and Educational Trust, Chicago; University of Alabama.

Long, Stephen H.; Settle, Russell F. and Stuart, Bruce C.—Reimbursement and Access to Physicians' Services under Medicaid

Several recent studies have shown that physician participation in state Medicaid programs is directly related to the generosity of their reimbursement levels. The implication is that when states reduce fees, Medicaid eligibles suffer because their access to physicians' services is thereby limited. The results presented in this paper do not support this implication. Multivariate analyses of utilization and site-of-visit patterns among nonelderly Medicaid eligibles indicate that stringent physician reimbursement practices do not impede access to ambulatory care when all sites at which a doctor may be seen are considered. The policy implications of this finding are discussed. *J. Health Econ.*, Sept. 1986, 5(3), pp. 235-51. Congressional Budget Office, Washington, D.C.; University of Delaware, Newark; Pennsylvania State University.

Manning, Willard G., Jr. and Wells, Kenneth B.—Preliminary Results of a Controlled Trial of the Effect of a Prepaid Group Practice on the Outpatient Use of Mental Health Services

Using data from the Rand Health Insurance Study, which randomly assigned families into a prepaid group practice and a fee-for-service insurance plan, this study finds different patterns of outpatient mental health care for the two groups. In the absence of cost sharing, fee-for-service participants are as likely as PGP participants to visit formally trained mental health specialists, but with 2.8 times greater imputed expenditures. Thus, fee for service provides more intensive therapy. Because participants are random samples of the same population, these differences result from institutional differences (and patient incentives for cost sharing) rather than adverse selection. *J. Human Res.*, Summer 1986, 21(3), pp. 293-320. The Rand Corporation.

**Schaub, Thomas—Bestimmungsfaktoren der Kosten eines Allgemeinspitals (Determinants of General Hospital Costs)**

In this paper a cost function for general hospitals in Switzerland is estimated. The results indicate that both increasing the bed occupation rate and reducing average length of stay reduces hospital costs per case. No influence is found for hospital size, however. The number of medical specialities increases costs per case. Finally, costs per case are also influenced by the way in which the medical staff is organized. The study indicates that the data base has to be improved if policy relevant conclusions should be drawn from such analyses. In particular, more complete information on the case mix of the patients is needed. *Schweiz. Z. Volkswirtschaft. Statist.*, Dec. 1986, 122(4), pp. 641-56 (German). University of Basel, Switzerland.

**Scheffler, Richard M. and Watts, Carolyn A.—Determinants of Inpatient Mental Health Use in a Heavily Insured Population**

This paper estimates a model of the demand for hospital inpatient mental health services using data on enrollees in the Blue Cross/Blue Shield Association Federal Health Benefits Plan 1979-81. The econometric analysis focuses on the impact of increased copayments and deductibles in the high-option plan. The results provide evidence that increases in outpatient copayments and deductibles reduce the utilization of both inpatient and outpatient mental health services. Of interest is the negative income elasticity of demand for hospital inpatient services and positive association between the relative availability of mental health providers and the demand for mental health care. *J. Human Res.*, Summer 1986, 21(3), pp. 338-58. University of California, Berkeley; University of Washington.

**Schoenman, Julie A. and Sloan, Frank A.—Why Have Surgeons Moved to the Country?**

Recent empirical work on the question of physician location has focused on population as a location determinant. Standard economic theory suggests that determinants of per capita demand and amenity levels would also play a role. This is tested using a multivariate probit

estimator where the dependent variable indicates presence of a surgeon and a migration model where the annual net change in the "young" surgeon-to-population ratio is the dependent variable. Population positively influences the probability that the county has a surgeon and net immigration as in past work, but the authors find few systematic influences for demand and amenity variables. *Quart. Rev. Econ. Bus.*, Autumn 1986, 26(3), pp. 25-47. Center for Health Affairs, Project HOPE; Vanderbilt University.

**Sloan, Frank A., et al.—Diffusion of Surgical Technology: An Exploratory Study**

The study presents an empirical analysis of the diffusion patterns of five surgical procedures. Roles of payer mix, regulatory policies, physician diffusion, competition among hospitals, hospital size, and spread of technologies are examined. The principal data base is a time-series cross section of 521 hospitals. Innovation is more likely to occur in markets where payers are relatively generous, but marginal effects of payer policies are small compared to effects of other variables. Hospital rate-setting sometimes retarded diffusion. Certificate of need programs did not. Coauthors are Joseph Valvona, James M. Perrin, and Killard W. Adamache. *J. Health Econ.*, Mar. 1986, 5(1), pp. 31-61. Vanderbilt University.

**Stoddart, Greg L., et al.—Tobacco Taxes and Health Care Costs: Do Canadian Smokers Pay Their Way?**

Through their health care utilization, smokers are generally perceived to be imposing a financial externality on nonsmokers within health insurance systems. To investigate the empirical basis for this view, the authors estimated publicly financed health care expenditure attributable to smoking for the Canadian province of Ontario, and compared it to tobacco taxes paid by Ontario smokers. Both initial estimates and the results of sensitivity analyses performed on key assumptions and parameters of the estimation methodology rejected the hypothesized existence of a financial externality arising from smokers' health care utilization. Coauthors are Roberta J. LaBelle, Morris L. Barer, and Robert G. Evans. *J. Health Econ.*,

Mar. 1986, 5(1), pp. 63-80. McMaster University, Hamilton, Ontario.

**Torrance, George W.**—Measurement of Health State Utilities for Economic Appraisal: A Review

This article reviews health status measurement for use in economic appraisal of health care programs, with particular emphasis on the measurement of health state utilities. Issues covered include alternative sources of utilities, health state descriptions, multi-attribute utility approach, determination of appropriate subjects, utility aggregation, and accuracy. Three measurement techniques for health state utilities are described in detail: rating scale, standard gamble, and time trade-off. The use of these methods is described for both chronic and temporary health states and for both health states considered better than death as well as those considered worse than death. *J. Health Econ.*, Mar. 1986, 5(1), pp. 1-30. McMaster University, Hamilton, Ontario.

**Wagstaff, Adam**—The Demand for Health: Some New Empirical Evidence

This paper presents some new estimates of the "pure investment" and "pure consumption" models of the demand for health. In contrast to previous studies, the paper presents parameter estimates of both reduced-form and structural demand for health care equations. The latter are obtained by treating health capital as a latent variable in a recursive equation system. The analysis of the pure consumption model differs from previous analyses in its recognition of the dependency of the shadow price of initial assets on the entire lifetime profiles of the model's exogenous variables. *J. Health Econ.*, Sept. 1986, 5(3), pp. 195-233. University of York.

**Zweifel, Peter**—Die Kosten-Versicherungs-Spirale im schweizerischen Gesundheitswesen (The Cost-Insurance Spiral in the Swiss Health Care Sector)

Beginning in the mid-1980s, the cost of health care has been increasing rapidly in Switzerland. At the same time, there has been a marked expansion of supplementary health insurance granting access to the (semi) private wards of

hospitals. This contribution asks the question whether the parallel development is to be interpreted as a cost-insurance spiral, of the type described by M. S. Feldstein (1973) for the United States. While microeconomic analysis would make such a spiral seem rather plausible for Switzerland too, only traces of it can be found in empirical work relating to the years 1976-80. *Schweiz. Z. Volkswirtschaft. Statist.*, Sept. 1986, 122(3), pp. 555-83 (German). Institut für empirische Wirtschaftsforschung, University of Zurich.

#### 915 Social Security

**Ycas, Martynas A.**—Asset Holdings of the Newly Disabled: Findings from the New Beneficiary Survey

This article reports on the asset portfolios of married couples and single persons who recently began receiving disabled-worker benefits. It contrasts groups differing by age, marital status, and sex, using data from SSA's 1982 New Beneficiary Survey. Ownership of at least some type of financial asset was fairly widespread, but the medial value was often quite small. Ownership of commercial assets was relatively uncommon. Most of the wealth reported was held in the form of home equity, but home ownership and indebtedness rates varied greatly by age and marital status. The disabled had relatively few assets overall. *Soc. Sec. Bull.*, Dec. 1986, 49(12), pp. 5-12. Social Security Administration.

**Halpern, Janice and Hausman, Jerry A.**—Choice under Uncertainty: A Model of Applications for the Social Security Disability Insurance Program

The authors specify a model of the application process for disability insurance, which is modeled as choice under uncertainty about approval of an application for disability insurance. The possible outcomes to the choice process of an individual in which probability of acceptance for disability insurance is a key consideration are specified. A joint model of labor supply and application to the Disability Insurance program based on the 1972 survey is estimated. Results are compared to the observed time series applications process since 1976. Lastly, the sensitivity of the application process to probability of

acceptance and level of benefits is estimated. *J. Public Econ.*, Nov. 1986, 31(2), pp. 131-61. Lexecon, Chicago; Massachusetts Institute of Technology.

Iams, Howard M.—Characteristics of the Longest Job for New Disabled Workers: Findings from the New Beneficiary Survey

This article describes the characteristics of the longest job held by new disabled-worker beneficiaries responding to questions in the 1982 New Beneficiary Survey. The characteristics include pension coverage, job duration, employer type, occupation, and industry. Many disabled workers reported having been covered by a pension plan. Pension coverage, pension receipt, and job tenure all increased with age, and older disabled workers had pension coverage similar to that of retired workers. Disabled and retired workers often differed in other job characteristics, but tended to become more similar with increasing age. *Soc. Sec. Bull.*, Dec. 1986, 49(12), pp. 13-18. Social Security Administration.

Karni, Edi and Zilcha, Itzhak—Welfare and Comparative Statics Implications of Fair Social Security: A Steady-state Analysis

This paper examines the steady-state welfare and comparative statics implications of fair social security in an overlapping generations model with uncertain lifetime. The model is designed to capture the effects of lifetime uncertainty extending over the individual's entire lifespan, the effects of intentional and unintentional bequests, and the effects of the earning profile. He shows that the welfare effects depend on the size of the benefits and the structure of the social security tax. In particular, even fair social security may have negative welfare implications if the underlying tax structure is ill-designed. Some comparative statics implications are analyzed. *J. Public Econ.*, Aug. 1986, 30(3), pp. 341-57. Johns Hopkins University; Tel-Aviv University.

Veall, Michael R.—Public Pensions as Optimal Social Contracts

A simple overlapping-generations model is modified to allow for an externality experienced by the young from consumption by the elderly. This sets up a game between generations in

which one strategy may be to save too little and rely on gifts from the young for retirement income. In such a model, pay-as-you-go social security can be a Pareto-optimal, "forced-giving" contract to restore efficient intertemporal allocation. *J. Public Econ.*, Nov. 1986, 31(2), pp. 237-51. McMaster University, Hamilton, Ontario.

Verbon, Harrie A. A.—Altruism, Political Power and Public Pensions

This article deals with the tax-transfer view on public pension schemes. It can be demonstrated that if workers are altruistic toward the elderly and decide on the benefit level of the public pension payment, then the Aaron condition, which is of importance in case the insurance view is adopted, shows up as well. Furthermore, it appears that for current decision making the future of the public pension system remains of importance. Next, in a representative democracy it appears that, in the particular form of the model used here, the influence of altruism cannot be separated analytically from the influence of political power. *Kyklos*, 1986, 39(3) pp. 343-58. University of Amsterdam.

#### 916 Economics of Law and Crime

Lui, Francis T.—A Dynamic Model of Corruption Deterrence

The paper presents a model of corruption deterrence with a simple overlapping-generations structure built into it. A crucial assumption is that when corruption becomes more prevalent in the economy it is harder to audit a corrupt official effectively. It is shown that this assumption may give rise to several stationary equilibrium levels of corruption. This possibility has been exploited to explain why sometimes a government may temporarily resort to an extremely severe deterrence policy and why the same deterrence scheme may imply quite different levels of corruption. A case study is provided to give empirical support to the model. *J. Public Econ.*, Nov. 1986, 31(2), pp. 215-36. State University of New York at Buffalo.

Yasiv, Gideon—Fraudulent Collection of Unemployment Benefits: A Theoretical Analysis with Reference to Income Tax Evasion

The harshest abusers of the unemployment insurance program are those employed who collect benefits while failing to report their employment. The paper analyzes fraudulent claiming behavior and optimal deterrence policy under two alternative penalty schemes, commonly used in tax evasion analyses; the one relates punishment to the magnitude of the dishonesty, whereas the other relates punishment to the amount of illegal returns. Two exclusive features of fraudulent benefit claiming are given special attention: the requirement to report at a labor exchange to demonstrate availability for work, and the need to serve a waiting period before benefits can be collected. *J. Public Econ.*, Aug. 1986, 30(3), pp. 369-83. Tel-Aviv University and National Insurance Institute, Jerusalem.

#### 918 Economics of Aging

Sjogren, Jane—Retirement Age Women and Men: Income Sources and Work

This paper investigates the changes in income, income sources, and work behavior of women and men as they pass through the conventional retirement age of sixty-five. Using data from the Retirement History Survey, the study finds that women who are heads of households are substantially worse off in financial terms than their male peers. However, despite their frequently dismal economic status, older women are less likely than men to turn to work as a means of increasing their financial well-being. *Eastern Econ. J.*, July-Sept. 1986, 12(3), pp. 283-90. Simmons College, Boston.

#### 920 CONSUMER ECONOMICS

##### 921 Consumer Economics; Levels and Standards of Living

Harrison, Beth—Spending Patterns of Older Persons Revealed in Expenditure Survey

Since 1980, the Bureau of Labor Statistics Consumer Expenditure Survey has been conducted on a continuing basis. As a result, trends for age and other demographic groups can be more effectively monitored over time. This article is but one of a series highlighting results from the expenditure survey. It divides the 1984 population age 65 and over into two groups: ages 65-74 and 75 and over. The results reveal that, although persons 65 and over are

often viewed as a homogeneous group, the characteristics, incomes, and needs of the younger and older populations within the larger group are quite different. *Mon. Lab. Rev.*, Oct. 1986, 108(10), pp. 15-17. Bureau of Labor Statistics.

Montgomery, Edward—Where Did All the Saving Go? A Look at the Recent Decline in the Personal Saving Rate

The inadequacy of aggregate saving is often cited as an explanation of low levels of capital accumulation and productivity growth in the United States. Aggregate saving is low, in large part, because of the steep decline in the personal saving rate that has occurred since 1975. This paper uses a modified life-cycle model to analyze the determinants of this recent decline in the personal saving rate. The empirical results do not support the hypothesis that the decline in the saving rate was the result of a reduction in the real rate of return. The reduction in the rate of growth of income and the changing demographic profile of the labor force are the most important factors in accounting for the fall in the personal saving rate. *Econ. Inquiry*, Oct. 1986, 24(4), pp. 681-97. Michigan State University.

Neldner, Manfred—Preisniveauschwankungen und privater Konsum: Zur empirischen Bedeutung des Pigou-Effekts in der Bundesrepublik Deutschland (Price Level Changes and Private Consumption: The Empirical Relevance of the Pigou-Effect in West Germany)

In West Germany price level fluctuations significantly influence real private consumption expenditures, in the manner suggested by Pigou in his famous attack on Keynes's theory of employment. This is demonstrated by estimating three different groups of consumption models using one-stage least square techniques. The empirical relationship between price level changes and real consumption, however, is open to various theoretical interpretations: besides the Pigou effect proper a neoclassical cash balance effect, a price illusion effect or a so-called negative income effect may have been at work as well. *Weltwirtschaft. Arch.*, 1986, 122(3), pp. 534-51 (German). Universität Osnabrück.

**Tachibanaki, Toshiaki and Shimono, Keiko—**  
Saving and the Life-Cycle: A Cohort Analysis

This paper examines the "life-cycle hypothesis" with reference to Japanese employees. The study is based on panel data created from successive cross-section data, which is expected to give better results than past studies. The sample was categorized by many elements. One important result is that empirical testing of the saving and the life-cycle is crucially dependent upon the samples. It is found that the majority of Japanese employees have not accumulated wealth enough to assure consumption during retirement. The paper, however, did not reject a hump-shaped course of wealth accumulation under the assumption of myopic behavior. *J. Public Econ.*, Oct. 1986, 31(1), pp. 1-24. Kyoto University; Nagoya University, Japan.

**Takacs, Wendy E. and Tanzer, Ellen P.—**  
Structural Change in the Demand for Automobiles by Size Class

This article tests the hypothesis that the gasoline crises of 1974 and 1979 caused a demand shift from large to small cars and an increased propensity of consumers to substitute the small, more fuel efficient models for the large in response to a rise in the price of gasoline. The authors estimate separate demand equations for subcompact, compact, and large cars—intermediates, full sizes, and luxuries—and enter in each equation dummy variables separating the pre- and post-crisis periods to test for the increased propensity of consumers to substitute small for large cars in response to a rise in that price. The impact of the crises on aggregate sales of new cars by size class is also estimated for each post-crisis year. *Quart. Rev. Econ. Bus.*, Autumn 1986, 26(3), pp. 48-57. University of Maryland, Baltimore.

**Taylor, Grant A. and Johnson, Lester W.—**  
The Frisch Conjecture and Demand Systems

In 1980, Ragnar Frisch wrote his now famous passage concerning the likely values of the income elasticity of the marginal utility of income (commonly known as the Frisch parameter). The empirical validity of the Frisch conjecture, however, is extremely difficult to test with commonly used demand systems. This paper dis-

cusses the issues of internal (within a data set) and external (across data sets) testing of the conjecture and provides a small illustrative external test using data for Australia and Sweden. Results also illustrate the sensitivity of Frisch parameter estimates to choice of demand system and serve as a warning to those researchers who use previously estimated values of the parameter in policy analysis. *Quart. J. Bus. Econ.*, Winter 1987, 26(1), pp. 63-77. University of Southern California, Los Angeles; Macquarie University, North Ryde, New South Wales, Australia.

**Termorshuizen, J. G.; Mouloung, M. T. G. and Wierenga, B.—**Consumer Behaviour in Respect of Milk in the Netherlands

In this paper, consumer behavior in the Netherlands in respect of milk is investigated using a model based on the EKB model, a so-called integrated model of consumer behavior. It is established that liquid milk is perceived as a neutral drink: not ordinary or luxury, as a food not a drink for pleasure, and not as being refreshing. Liquid milk is perceived differently at varying times of consumption during the day. The most important socioeconomic variables explaining individual differences in consumer beliefs regarding milk are: age, level of education, and residential area. *Europ. Rev. Agr. Econ.*, 1986, 13(1), pp. 1-22. Post and Telecommunications, The Hague; Agricultural University, Wageningen, the Netherlands; Graduate School of Management, Rotterdam.

**Venti, Steven F. and Wise, David A.—**Tax-Deferred Accounts, Constrained Choice and Estimation of Individual Saving

The paper analyzes the effect of tax-deferred individual retirement accounts (IRAs) in the United States on net individual saving. The results are based on a model of constrained optimization with the limit on tax-deferred saving the principle constraint. The estimates suggest that contributions to IRAs represent substantial net saving increases. Were the IRA limit to be increased, only about 10 to 20 percent of the resulting increase in IRA contributions would be taken from other savings. About 50 percent would come from reduced consumption and about 35 percent from reduced taxes. *Acc.*

*Econ. Stud.*, Aug. 1986, 53(4), pp. 579-601. Dartmouth College; Harvard University.

Viscusi, W. Kip; Magat, Wesley A. and Huber, Joel—Informational Regulation of Consumer Health Risks: An Empirical Evaluation of Hazard Warnings

On the basis of data from a survey of almost 400 consumers, this article assesses whether consumer behavior is responsive to information about product hazards that is provided in response to regulation. The authors find that the extent to which consumers take precautions is consistent with the level of risk indicated, the amount of risk information, the specific risk and precaution indicated, and the economic benefits of safety precautions. The patterns of precautionary behavior are also used to analyze the implicit value of the morbidity effects and to assess the consistency of consumer choices. The findings support the use of product-hazard information as an alternative to more direct regulation of safety risks. *Rand J. Econ.*, Autumn 1986, 17(3), pp. 351-65. Northwestern University; Duke University; Duke University.

### 930 URBAN ECONOMICS

931 Urban Economics and Public Policy

Scotchmer, Suzanne—The Short-run and Long-run Benefits of Environmental Improvement

The social value of a nonmarginal improvement to amenities is not related to hedonic prices in a simple way. Furthermore, hedonic price data do not completely reveal preferences. In order to evaluate short-run benefits of an improvement, the rate of change of the hedonic price function must be normalized by a ratio of population densities. To calculate long-run benefits of the improvement, one must calculate the responsiveness of population densities to the nonmarginal improvement. A technique to do so is suggested. *J. Public Econ.*, June 1986, 30(1), pp. 61-81. Harvard University.

932 Housing Economics

Börsch-Supan, Axel—Household Formation, Housing Prices, and Public Policy Impacts

The paper specifies and estimates a model of housing demand that explicitly includes the

decision of individuals to form independent households. Parameter estimates reveal a considerable response of headship rates not only to income, but also to housing prices. Analysis of housing policies ignoring the endogeneity of household formation is thus potentially biased. The model is employed to evaluate the effects of a housing voucher program. Simulated responses indicate that such a program creates a substantial additional demand for housing due to its positive impact on the propensity of young and elderly persons to live independently. *J. Public Econ.*, July 1986, 30(2), pp. 145-64. Harvard University.

Gerber, Robert I.—The Comparative Static Response of Rental Housing to a Price Change: Inflation and Government Policy

A two-period consumer choice model is presented in which housing is treated as a quality differentiated good. The short-run comparative static response of rental housing to a price change is examined via an example, an exogenous increase in the inflation rate. Two stylized facts are alternately used; interest income is taxed, and interest rate ceilings are imposed on small savings deposits. The partial equilibrium distributional impact of inflation, in the context of rental housing markets, is also discussed. *J. Reg. Sci.*, Nov. 1986, 26(4), pp. 731-43. State University of New York at Albany.

Parsons, George Russell—An Almost Ideal Demand System for Housing Attributes

Demand functions are estimated for four housing attributes: housing size, housing features, housing quality, and neighborhood quality. The model is a restricted version of Sherwin Rosen's implicit market model in the form of Angus Deaton and John Muellbauer's Almost Ideal Demand System. Housing markets are assumed to be segmented by city of location and time period, a sufficient restriction for identification of the parameters of the demand functions. Conventional properties of consumer behavior are maintained hypotheses. Estimated price and expenditure elasticities are presented, and a practical application of welfare measurement using the results is presented for an exogenous, nonmarginal improvement in neighborhood quality. *Southern Econ. J.*, Oct.

1986, 53(2), pp. 347-63. University of Delaware, Newark.

### 933 Urban Transportation Economics

**Dodgson, J. S.**—Benefits of Changes in Urban Public Transport Subsidies in the Major Australian Cities

This paper considers the economic efficiency benefits of urban public transport subsidies and presents estimates of the marginal benefits of fare and service level changes in the main Australian cities. Models are outlined, and estimates compared of the benefits to public transport and other road users of fare and service level changes in different cities. Existing urban public transport subsidies might be more effective from an economic efficiency point of view if frequency levels were reduced and the consequent cost savings used to finance lower levels of fares. *Econ. Rec.*, June 1986, 62(177), pp. 224-35. University of Liverpool.

### 940 REGIONAL ECONOMICS

#### 941 Regional Economics

**Booth, Douglas E.**—Long Waves and Uneven Regional Growth

The central thesis of this article is that regions experience long periods of sustained rapid economic growth followed by relatively lengthy periods of slow economic growth. The fundamental reason for lengthy periods of poor growth is an absence of entrepreneurial activity during the sustained growth phase needed to create new industries that will replace old industries at the end of their product life cycles. Historical data on manufacturing employment growth and regression results on the determinants of new incorporations are presented to support the long wave theory. *Southern Econ. J.*, Oct. 1986, 53(2), pp. 448-60. Marquette University.

**Löfgren, Karl Gustaf**—The Spatial Monopsony: A Theoretical Analysis

In this paper some of the most important properties of the behavior of a spatial monopsonist are derived. Many results are mirror images of corresponding results for the spatial monopolist. A few results are, however, genuinely new. A lot of effort is spent in comparing the properties of the profit function under three different pricing policies, f.o.b. (mill) pricing,

uniform delivered pricing, and spatial price discrimination. It is shown, for example, how the profitability and welfare consequences of the different policies are related to the shapes of the supply and demand functions. It is argued that the theory may have important applications in economic analyses of renewable natural resources such as forests, where total transportation costs are nonnegligible. *J. Reg. Sci.*, Nov. 1986, 26(4), pp. 707-30. Swedish University of Agricultural Sciences.

**Mathis, Stephen A. and Posatho, Robert C.**—Local Government Expenditures and Private Sector Output: Theory and Evidence on Crowding Out at the Regional Level

The rationale underlying the focus of this article is the crowding-out hypothesis. The term "crowding out" is interpreted to encompass not only the traditional implications of debt creation, but also any associated tax effects. Methodologically, the article utilizes a basic production-oriented classical model to examine the effects of local government fiscal decisions on privately produced output in metropolitan areas. *Quart. Rev. Econ. Bus.*, Autumn 1986, 26(3), pp. 105-15. Shippensburg University of Pennsylvania.

**McGuire, Martin C.**—Private Production, Collective Consumption, and Regional Population Structure: The Interactions between Public and Private Good Provision as Determinants of Community Composition

Theories of trade and migration explain the distribution of individuals among regions based on private good productivities. The theory of local public goods (LPGs) uses collective good consumption economies to explain the size and composition of communities. This essay combines the two theories, to explore regional population heterogeneity and stability. Assuming that individuals must consume and produce in the same jurisdiction, the paper examines the nature of efficient allocations, the tensions between the private and public incentives, the nature of the equilibrium (if any) that migration among jurisdictions will generate, and how such equilibrium will depend on tax rules for sharing the costs of the LPG. *J. Reg. Sci.*, Nov. 1986, 26(4), pp. 677-705. University of Maryland.

**Salant, David J.**—Equilibrium in a Spatial Model of Imperfect Competition with Sequential Choice of Locations and Quantities

This paper addresses the issues of existence of a pure strategies Nash equilibrium in a simple, general equilibrium spatial model. The model is fairly standard, with two exceptions: firms choose quantities, instead of prices, as well as their locations. Additionally, the market has endpoints. Firms choose locations one at a time and before making their quantity choices. The sequential choice of locations and then quantities, instead of prices, is argued to be both more realistic for many types of markets, and analytically convenient. The existence of endpoints will have important implications on the nature of equilibrium. *Can. J. Econ.*, Nov. 1986, 19(4), pp. 685-715. Virginia Polytechnic Institute and State University.

**Thore, Sten**—Spatial Disequilibrium

The well-known extremal principle for the solution of spatial equilibrium for a single commodity (Paul Samuelson [1952]) is extended to deal with the case of disequilibrium caused by rigid prices and/or price controls. Both disequilibrium in consumer markets and in factor markets is covered. The study of disequilibrium is

well known in general interdependent economic systems (the so-called fixed-price model of interdependent systems). The present work extends this approach to the spatial dimension, and shows how it is possible to represent and solve disequilibrium models by mathematical programming rather than by fixed-point techniques. *J. Reg. Sci.*, Nov. 1986, 26(4), pp. 661-75. University of Texas at Austin.

**Wheat, Leonard F.**—The Determinants of 1963-77 Regional Manufacturing Growth: Why the South and West Grow

This paper analyzes 1963-77 manufacturing employment growth in the forty-eight contiguous states. Six factors jointly explain 96 percent of the variance. Markets explain 55 percent; climate, 15 percent; a rural state attraction, 11 percent; unionization, 6 percent; thresholds, 5 percent; and amenities, 4 percent. Resources, taxes, and business climate lack significance. Sunbelt-Frostbelt is a false dichotomy; the Northwest grew as fast as the South. The real contrast—largely caused by markets—is between growth rates of 6 percent in the Manufacturing Belt, 35 percent in its bordering Transition Zone, and 58 percent in the combined South and West. *J. Reg. Sci.*, Nov. 1986, 26(4), pp. 635-59. U.S. Department of Commerce

# Index of Authors of Articles in the Subject Index

This *Index* includes all articles included in the *Subject Index*; the numerical references (arranged randomly) are to the *subject classification(s)* of the article. Classifications for different articles by the same author are separated by a semicolon; *page number(s)* for abstracts appear in *italics* in parentheses for articles with abstracts. If an article is written by two or three authors, each author is listed separately; if by four or more authors, it is listed under the first author only, followed by *et al.*

The list, produced by computer, is alphabetized letter by letter; the entry is then truncated to the last name and initials. This method leads to such anomalies as: (1) an author may be listed twice if only initials appear in one article and full name(s) in another; (2) alphabetization may appear to be incorrect on the second initial.

ARTHUR H. GOLDSMITH

*University of North Carolina, Chapel Hill*

*We thank Lincoln Anderson, Orley Ashenfelter, Costas Azariadis, David Card, William A. Darity, Jr., Belton Fleisher, Richard Froyen, James J. Heckman, Solomon Polachek, Lawrence H. Summers, and two anonymous referees. Particular thanks go to Didi Dunphy for drafting the figures and to the University of North Carolina, College of Arts and Sciences, Endowment for Scholarly Publications for providing financial support. Sarah Mason did her usual fine job of typing, Karen Smith and Jonathan Veum provided valuable computing assistance, and Cynthia McCarty cheerfully checked citations for completeness and correctness. Preliminary versions of this paper have been presented at the 1982 Annual Meetings of the Econometric Society, the Fifth World Congress of the Econometric Society, 1985, and the 1986 Annual Meetings of the Eastern Economic Association.*

## I. Introduction

THE AUCTION-MARKET ANALYSIS of prices and quantities is the core of neoclassical economics; however, as we will see, viewing the aggregate labor market as an auction has not proved particularly useful for understanding cyclical fluctuations in employment, unemployment, and the real wage. Do any of the theoretical alternatives to the auction interpretation produce an empirically superior description of a U.S. recession, though? The purpose of this paper is to survey these issues and to summarize what econ-

omists can honestly tell students and policymakers concerning how the aggregate U.S. labor market operates when subjected to business cycle disturbances.

In the remainder of this section we lay the groundwork necessary to evaluate the state of our economic knowledge of the aggregate labor market. In particular, we first present macroeconomic facts that summarize the typical postwar recession in the United States. Keeping them in mind, we then examine how well this summary meshes with the outcomes one would expect from an economy with an aggregate labor market that operates as

Figure 2. The Distribution of Unemployment by Reason

an auction, at least during the short term. The last part of this section previews the remainder of this review, which evaluates the literature attempting to test three types of theories of the aggregate labor market: (i) models that reformulate the basic auction analysis, (ii) models that view the aggregate labor market as characterized by persistent disequilibrium, and (iii) models that synthesize (i) and (ii) and treat workers and firms as governed by the outcomes of long-term contracts for labor services.

#### A. The Typical U.S. Recession

During the typical postwar U.S. recession, which lasts about 10 to 12 months, real GNP falls 2 to 3 percent, nonfarm employment falls 2 to 4 percent, and the unemployment rate rises 2 to 4 percentage points (Victor Zarnowitz 1985). The association between the business cycle and the unemployment rate is highlighted in Figure 1, where we plot the annual unemployment rate against annual proportionate deviations in real GNP from its postwar log trend. A regression equation fit to these data tells

us that, on average, the annual unemployment rate rises by about one-third of a point for each one percentage point shortfall of real GNP from its annual post-war log trend level.

The increased flows into unemployment during a recession stem mainly from new layoffs and firings. Quits, which are terminations of the employment relationship initiated by employees, fall dramatically. This is underscored in Figure 2 where we compare 1978, which is typically categorized as a full-employment year, to 1982, which is the worst recession year since the Great Depression. Finally, while many additional individuals claim to be interested in but unable to find work during a recession, the aggregate real wage does not decline. During the heart of the recent severe recession, 1981:IV to 1982:III, real compensation per hour in the nonfarm business sector rose by about 1 percent. More generally, the measured aggregate real wage in the United States moves randomly around a positive trend (Joseph Altonji and Orley Ashenfelter 1990). This result holds when either annual or quarterly data are

used and means that the best predictor of next period's real wage is last period's real wage plus a constant.<sup>1</sup> This constant is given by the estimated intercept in a regression of the real wage on its value lagged one period.

For those readers interested in a more complete quantitative summary of postwar business cycles, Table 1 displays regression estimates of the elasticities of seven different aggregate labor market

outcomes with respect to annual movements in real GNP, controlling for a quadratic time trend. As just noted, probably the most startling results appearing in this table concern the associations between wages and real GNP. Table 1 underscores that both the aggregate real wage and the aggregate nominal wage are statistically independent of real output. Moreover, the elasticity of aggregate employment with respect to real GNP is over twice the elasticity of the average workweek with respect to real GNP. Thus, cyclic movements in labor utilization appear to be dominated by changes in the number of workers with jobs rather than characterized by short

<sup>1</sup> It is important to recognize, however, that Altonji and Ashenfelter did not consider many alternatives to this rather restrictive specification (a random walk with drift). More complex empirical specifications of the time-series process underlying real wage movements are examined in Thomas McCurdy (1982).

hours or worksharing arrangements. Any satisfactory model of the aggregate labor market must be consistent with these empirical regularities in Table 1. The next section examines how well the stylized facts developed in this section square with the most basic of all economic tools, supply and demand analysis, applied to the aggregate U.S. labor market.

#### **B. An Auction Labor Market During a Recession**

According to the basic supply and demand model of the labor market (for example, Belton Fleisher and Thomas Kniesner 1984, Chapter 5), wage-employment outcomes are viewed as the result of an auction between buyers and sellers of labor. Purchases and sales of labor services take place on a continuous basis, and the duration of the agreement is left unspecified. In particular, the agreement to sell (purchase) labor services lasts only until one party wishes to terminate it. Labor supply, which is presumed to be sensitive to wages, fringes, and (dis)amenities of the workplace, is conditioned by worker preferences and nonlabor incomes. In addition to the costs of labor, the demand for labor is sensitive to consumer product demand, the state of technology, and nonlabor input costs. Given the resulting labor supply and demand schedules, the neoclassical labor market has the characteristic of an invisible auction during which the wage is driven toward an equilibrium level. In such an auction, the real wage moves without hindrance to equate the demand for labor with the supply of labor at all times.

The purpose of an economic model of the labor market is to help us understand the influence of changes in the economic environment on labor market outcomes. For example, if new health hazards are introduced into the work environment,

employees are likely to request additional hourly compensation so that the labor supply curve shifts upward. In the long run, then, we should observe relatively higher wages and relatively less employment in comparatively dangerous jobs. Additional compensation for risk of this sort has been well documented in the empirical literature (Sherwin Rosen 1986). Moreover, the auction interpretation of the labor market has helped economists identify temporary wage differences, such as interregional wage differentials, which tend to be eliminated by mobility of labor and capital (Don Belante 1979). The neoclassical auction model has also proved useful in measuring the long-run forces accounting for cross-sectional differences in labor market outcomes, including the economic effects of labor unions (H. Gregg Lewis 1986). Of course, interpreting the labor market as an auction has not always been helpful in a cross-sectional context (Robert Smith and Ronald Ehrenberg 1983). More importantly, though, the concept of an auction for labor has been *particularly unsatisfactory* in helping economists understand aggregate changes in real wages, employment, and unemployment over time in an economy characterized by cyclic fluctuations in labor demand.<sup>2</sup>

Consider an aggregate economy with the single labor market depicted in Figure 3. This labor market is initially in equilibrium at point A with real wage  $w(0)$  and employment  $N(0)$ . Now let product demand decline as the result of a recession. If firms could predict what would happen to the demand for their

<sup>2</sup> A word of caution is in order here. Macro empirical models that rely on the concept of a representative worker or firm may fail to produce structurally interpretable parameters, and simplistic applications of micro auction market models to the macroeconomy should be viewed skeptically (Thomas McCurdy 1986b).

Figure 3. The Effects of a Recession in a Spot Market for Labor

products over the business cycle, and if goods (and services) could be cheaply stored for future sale, then a temporary decline in the aggregate demand for output would not necessarily lead to a similar decline in the demand for labor. Firms could maintain production and employment and hold the output for sale in the future; however, firms know neither the length of any given recession nor its effect on their sales, and output cannot typically be stored at low cost, or even stored at all. Finally, the behavior of buyers will change in unpredictable ways during the business cycle.

All this means that when the demand for output rises or falls, the demand for labor will tend to move in the same direction. Thus, profit-maximizing firms will want to reduce wage rates or their labor inputs during a recession. This generates the decline in labor demand to  $D'$  in Figure 3. The initial effect is excess labor supply at wage  $w(0)$ . If the real wage adjusts, then the auction model suggests a decline to  $w(1)$  along with a reduction in the quantity of labor to  $N(1)$ . Exactly how is the employment level reduced?

In the postwar United States, the pre-

dominant portion of a typical recession-induced reduction in the aggregate labor input is a reduction in the number of employed workers, rather than a shortening of the average workweek. (Table 1 showed us that the proportionate variation in aggregate employment was more than twice that of the average workweek over the business cycle.) The reduction in the real wage level that would occur in an auction market during a recession moderates the extent of layoffs, though. As the real wage falls, some workers no longer find it optimal to participate in the labor force and they specialize, instead, in household production. Thus, a decline in production and labor demand leads to an increase in both layoffs and quits in the simple auction market described in Figure 3.

Once equilibrium is reestablished at point B in the auction market depicted in Figure 3, all those willing to work at (the lower) real wage  $w(1)$  are able to work, and employment has declined to  $N(1)$ . The unemployment rate should again be at its so-called natural or normal level because equilibrium cyclical unemployment is zero in an auction market. Of course, the natural rate of unemployment associated with  $N(1)$  may differ from the natural rate when employment is  $N(0)$ . If, as is commonly felt, normal unemployment is a micro phenomenon, and therefore, largely independent of the business cycle, then the normal unemployment *rate* will be higher at point B because the labor force is smaller by the amount  $N(0) - N(1)$ . Moreover, Allan Drazen (1985) argues that the loss of firm-specific training by laid-off workers further raises the normal unemployment rate. It is more important to note, however, that the economist's basic supply and demand model implies that the economy will be void of cyclical or involuntary unemployment even though the recession has reduced the demand for labor. There is a job available for everyone will-

ing to work at the lower real wage,  $w(1)$ .

To summarize, the stylized facts describing the typical U.S. recession are greatly at odds with the predictions of a simple supply and demand model of the aggregate labor market. In Section I.A. we saw that during a recession real wages do not fall, quits fall rather than rise, and unemployment increases (largely through layoffs) much more than the auction model leads us to expect. Can the inconsistency between the predictions of the simple auction model of the aggregate labor market and the macroeconomic evidence be readily explained?<sup>3</sup>

### *C. Can the Auction Interpretation Be Easily Rescued?*

Given a recession-induced decline in production and labor demand, the labor market will not clear in the manner just described if the real wage does not fall. In this case the resulting employment and unemployment movements will conform to the aggregate data for the typical postwar U.S. recession. Specifically, if labor demand is reduced to  $D'$  but the real wage remains at  $w(0)$  in Figure 3, employment will drop to  $N(2)$ . Because the real wage is unchanged, excess labor supply, or cyclic unemployment, equal to  $N(0) - N(2)$ , results. It is also unlikely that quits will be the source of this unemployment in light of a rigid real wage, so an economic contraction produces additional unemployment primarily composed of layoffs. Compared to the impli-

cations of an auction market with a flexible real wage, employment should now fall to a greater extent,  $N(0) - N(2)$  versus  $N(0) - N(1)$ . Relatively low employment,  $N(2)$ , is expected to persist along with relatively high unemployment when the real wage is rigid.

The argument that real wage rigidity is responsible for cyclical unemployment and the other stylized facts describing U.S. recessions occupies an important role in simple Keynesian models of the aggregate economy (John M. Keynes 1936, 1939); however, simply to note that the aggregate real wage does not fall with employment during an economic contraction takes us no further intellectually than a mechanical explanation of observed labor market outcomes. What is needed is a convincing argument for the source of the real wage rigidity. Some economists attribute the inflexibility to transaction costs (Peter Howitt 1985) while others focus on long-term contracting (Costas Azariadis 1975, 1979). Institutional rigidities and customs have also been offered as an explanation for rigid real wages (Drazen 1980; George Akerlof 1980). A key aspect of this review is to evaluate the empirical support for these suggested reasons for aggregate real wage rigidity. In doing this our discussion always centers on whether labor market data suggest a model other than a simple auction. In the next section we examine attempts to rescue the auction interpretation of the aggregate labor market by developing more complex representations of labor supply and demand.

## *II. Reformulations of the Auction Approach*

### *A. Evidence Focusing on the Role of Labor Supply*

1. *Real Wage Misperceptions.* The seminal paper by Robert Lucas and Leonard Rapping (1969) focuses on an aggregate auction labor market where real

<sup>3</sup> Practitioners of the so-called new time-series analysis have chosen to dispense with theoretically modeling the economic forces underlying macroeconomic outcomes and to focus, instead, on discovering the stochastic relations describing the cyclic properties of economy-wide data (see Robert Fildes and Daniel Rubinfeld 1981, Chapters 15-20). We ignore these efforts in this review, however, because "the fact that time-series models may produce better forecasts than econometric models simply points to the need for improving econometric models rather than replacing them by the ad hoc models of time-series analysis" (Jan Kmenta 1986, p. vi).

Figure 4. The Relationships Among the Current Real Wage, the Expected Real Wage, Labor Supply, and Cyclical Unemployment

wages are flexible, yet wage adjustments need not eliminate unemployment. The essence of their argument is that the unemployed do not represent a genuine offer to sell labor. So, while there may be an auction market in which the real wage adjusts in each and every period to equate labor supply and labor demand, there can be cyclical unemployment if workers' real wage expectations are not in line with reality. In particular, suppose that when a recession hits, some workers expect to be paid more than the actual real wage. As a result they try to supply labor in excess of the amount firms desire to hire, and this excess supply of labor will manifest itself in unemployment. The systematic movement in the difference between expected and actual real wages over the business cycle is what generates regular, cyclical unemployment in the economy just described.

To see this more carefully consider Figure 4, where the prevailing real wage is  $w(0)$ . The economy is in a recession and labor demand, which depends on the

actual real wage, is  $D'$ . If workers' expected real wage,  $w^*(0)$ , were identical to the prevailing real wage, then there would be no cyclical unemployment at the actual employment level,  $N(0)$ . In Lucas and Rapping's basic model, cyclical unemployment may exist because workers' labor supply depends on the expected real wage, which does not immediately adjust downward even if the actual real wage does. As a result, there is an excess supply of labor,  $N(*) - N(0)$ , at the prevailing real wage,  $w(0)$ .

It is important to note that this explanation of cyclic unemployment conforms nicely to some basic perceptions of the job-search behavior of the unemployed (see Dale Mortenson 1970). In particular, once searchers bring their real wage expectations in line with the prevailing real wage, cyclical unemployment will be eliminated. This suggests that if government agencies were to subsidize the collection, dissemination, and publication of job vacancy and current wage information, people would realize their true la-

bor market opportunities more quickly, which would in turn lower cyclical unemployment;<sup>4</sup> however, the aggregate U.S. data do not seem to possess the real wage misperceptions necessary for this interpretation of cyclical unemployment to hold.

As we noted in the introduction, quarterly or annual movements in the aggregate real wage are neatly described as varying randomly around a positive trend. For the aggregate U.S. labor market, then, the correspondence between the actual real wage and the real wage imputed by various forecasting mechanisms is quite high.<sup>5</sup> Altonji (1982) emphasizes this by considering a number of different expectations formation mechanisms, including rational expectations. This in turn implies quite small real wage misperceptions at the aggregate level. As a result, it is difficult to argue that such misperceptions form the basis of an explanation for cyclical unemployment within the context of an aggregate labor market model.<sup>6</sup>

2. *The Substitution Hypothesis.* Real wage misperceptions are certainly not required for cyclical unemployment to exist

<sup>4</sup> Some anecdotal evidence is interesting here. During the 1982-83 recession, the Department of Labor ran a number of experiments designed to examine the efficacy of some new ways to reduce long-term unemployment including something known as a Jobs Club, which is a type of encounter group where people meet to discuss their feelings and problems associated with their unemployment. Such groups seemed to be a cheap way to get the long-term unemployed back to work. By discussing their situation Jobs Club members apparently obtain a more accurate estimate of their true labor market opportunities (wage offers), and lower their reservation wages and return to work more quickly than otherwise similar workers not in a Jobs Club (conversation with Malcolm R. Lovell, Jr., Under-Secretary of Labor, November 1983).

<sup>5</sup> For example,  $R^2 = 0.999$  in Altonji's (1982) forecasting equation for the aggregate real wage.

<sup>6</sup> Of course, real wage misperceptions may still be important at the individual level but masked in the aggregate data. We return to this issue and how it relates to testing models of the aggregate labor market in Section II.A.5.

in the auction market set out by Lucas and Rapping. (This point is emphasized by Robert Hall 1980a, 1980b.) Observed cyclical patterns of employment and unemployment could also stem from workers substituting labor in one period for labor in another in the absence of any wage uncertainty. To see this, return to Figure 3 and interpret  $S$  as the short-run labor supply schedule. When the recession hits and demand declines to  $D'$ , downward pressure on the real wage leads to a reduction in employment and quantity of labor supplied to  $N(1)$ . Put differently, workers substitute their labor away from a time period (the recession) when the real wage may be temporarily low.

The substitution hypothesis of cyclical unemployment links the rise in unemployment during a recession to this voluntary withdrawal of labor by workers who wish to substitute current leisure for work in some future period when they expect the real wage to be higher. It is important to emphasize that under the substitution hypothesis workers can correctly perceive that their real wages are temporarily low during the recession, and some therefore withdraw from the labor force; however, it is possible for the  $N(0) - N(1)$  workers in Figure 3 to be recorded in the aggregate statistics as unemployed. This could happen, for example, because workers interpret the Current Population Survey as asking "Would you take a job at your *normal* wage,  $w(0)$ ?" instead of asking, "Would you take a job at the *current* wage,  $w(1)$ ?"

Let us now do a quick "back-of-the-envelope" calculation to arrive at an estimate of the short-run aggregate labor supply elasticity necessary for the substitution hypothesis to have some credibility. As noted earlier, nonfarm employment falls about 2 to 4 percent during the typical postwar recession (Victor Zarnowitz 1985). Suppose, further, that we

weaken other results cited earlier and entertain the *possibility* that the real wage may fall, by say 1 percent, during a recession.<sup>7</sup> Together these two pieces of information imply a minimum value for the wage elasticity of aggregate labor supply if the substitution hypothesis is to "hold water." Specifically, the aggregate supply of labor (expressed in terms of total employment) must have an elasticity with respect to the real wage of *at least* +2.0 if it is to provide the basis for an explanation of cyclical movements in aggregate employment and unemployment.

An important empirical issue, therefore, has been to determine whether an elasticity of this magnitude is consistent with econometric estimates of labor supply functions. This is less than straightforward because most empirical labor supply research investigates the determinants of (annual or weekly) hours of work per worker, whereas the predominant portion of the cyclic movements in the aggregate labor input is changes in the number of employed workers.

3. *The Aggregate Labor Supply Function.* The short-term wage elasticity of labor supply (total hours of work per household) that Altonji (1982) estimates from economy-wide annual data is more often negative or statistically insignificant than highly elastic ( $> +2.0$ ). Altonji's conclusions concerning the lack of empirical support for the substitution hypothesis have been consistently supported in the research using aggregate U.S. data (Ronald Warren 1983; N. Gregory Mankiw, Julio Rotemberg, and Lawrence Summers 1985; John Seater 1985; Michael Luger and Dale Stahl 1986).<sup>8</sup>

Along these lines, Kim Clark and Lawrence Summers (1982) use both aggregate time-series and aggregate cross-section data (for states) to try to address the question of timing versus persistence in labor force participation rates. The substitution hypothesis requires dominant timing effects, whereby individuals seek employment when demand is above normal and leave the labor force when labor demand is below normal.<sup>9</sup> Clark and Summers examine both labor force participation and employment as dependent variables in the aggregate labor supply function. Keep in mind that, according to the substitution hypothesis, workers who choose not to work because of a temporary decline in their real wage may be misclassified as unemployed. As a result, they will still be counted as labor force participants. In this way, using the labor force participation rate as the dependent variable may obscure the labor force movements implied by the substitution hypothesis. The evidence Clark and Summers present suggests that timing effects are of little or no importance in determining cyclic fluctuations in either employment or labor force participation. Their estimated elasticities of labor supply with respect to current wage changes are small and sometimes negative. They also find no evidence of a negative relationship between expected future wages and current labor supply, which is implied by the substitution hypothesis.<sup>10</sup>

4. *The Problem of Model Specification.* In tests of the substitution hypothesis, the utility function is usually assumed to be strongly separable over time so that

<sup>7</sup> See Section II.C.3 for more discussion of the cyclicalities of real wages in the United States.

<sup>8</sup> Additional in-depth analysis of the aggregate time-series data for the United States in general is contained in Jeffrey Miron (1984, especially Chapter V).

<sup>9</sup> This is also the essence of the early research on so-called added and discouraged worker effects and their relationship to "hidden" unemployment. See Jacob Mincer (1986).

<sup>10</sup> For more elaboration on the issue of timing versus persistence see the exchange between James Heckman and Robert Willis (1979) and Jacob Mincer and Haim Ofek (1979).

the marginal utilities of current aggregate consumption and aggregate labor supply depend only upon current values of these two variables. Some economists contend that strong separability is inherently inconsistent with the substitution hypothesis because it constrains the relative size of the labor supply response (Finn Kydland and Edward Prescott 1982; Robert Barro and Robert King 1984; Joseph Hotz, Finn Kydland, and Guilherme Sedlacek 1986). They recommend basing empirical labor supply research on a less restrictive household preference function—one where the marginal utility of consumption or leisure in the current period depends upon consumption and leisure in other periods too; however, such a specification is quite complex and difficult to implement empirically. At present there is not enough empirical research to judge whether this greater complexity is worth the extra effort. More specifically, while Hotz et al. find evidence that current utility depends on leisure in previous years, Terry Johnson and John Pencavel (1984) estimate a dynamic model with intertemporal nonseparability and fail to find a wage elasticity of labor supply large enough to rescue the substitution hypothesis.

Concerning specification of a model of the aggregate labor market, Pencavel (1986) reminds us that while some researchers are regressing aggregate average hours of work on the aggregate average wage and interpreting the results in terms of labor supply income and substitution effects, other researchers are using the same data in quite similar regression equations and interpreting the results in terms of structural parameters of aggregate labor demand functions. The first group views the negative secular relationship between hours and wages, *ceteris paribus*, as a downward-sloping labor supply function, and the second group sees it as an inelastic labor demand

schedule. While both sets of researchers might be correct, it seems unlikely. In particular, the results in Luger and Stahl (1986) underscore how difficult it is to interpret regression equations estimated with aggregate data as demand and supply functions and then use them to test the hypothesis of whether the labor market clears. To our knowledge, no one addresses the identification problem satisfactorily, and we are hard pressed to see how it can ever be solved using aggregate labor market data unless labor supply and demand decisions are not based on neoclassical behavior whereby wages adjust to equate labor supply and demand.

5. *Microeconomic Studies of Labor Supply.* As we have just seen, research on the substitution hypothesis has generally assumed that the economy's aggregate labor market outcomes may be viewed as the result of the interaction between a representative household supplying labor and a representative firm demanding labor. Having noted this unrealistic assumption, it is important that we now address the issue of whether microeconomic studies of labor supply are of much value in testing the substitution hypothesis.

To be of any help, labor supply analyses of individual data must have several characteristics. First, they must incorporate uncertainty. By this we mean that the econometric methods must be appropriate to a situation in which the decision maker in a life-cycle labor supply model is uncertain about his or her economic future because of, among other things, business cycles. In this case, estimation requires a regression model involving a complex error structure reflecting accumulated forecasting mistakes (Richard Blundell and Ian Walker 1984; MaCurdy 1985a; Pencavel 1986). Second, in order to shed light on aggregate movements in employment, microeconomic research must account for changes in labor force

participation rather than variations in hours of work of the continuously employed. Third, while the empirical model may emphasize the role of the supply of labor, it must also specify something about the demand for labor. A partial analysis of annual labor supply may tell us very little about whether the labor market is an auction if only one side of the market is modeled econometrically. More specifically, we probably learn little about whether the aggregate labor market is an auction when the empirical analysis is of how individual workers respond to wage changes without any regard for the reason(s) underlying the wage change.

Although a number of microeconomic studies of labor supply<sup>11</sup> satisfy one or two of the three requirements set out in the previous paragraph, none we know of satisfies them all. While MaCurdy (1983) develops an econometric specification that allows direct estimation of the marginal rate of substitution between consumption and leisure and permits a clear role for economic uncertainty, he is primarily interested in the hours of work dimension of labor supply, as is Altonji (1984, 1986).<sup>12</sup> Although Heckman and MaCurdy (1980, 1982) address the issue of annual female labor force participation, they ignore uncertainty in wages and wage expectations. It is also hard to infer the business cycle's impact on annual labor force participation from the parameter estimates they present. More-

over, Heckman and MaCurdy conclude that transitory fluctuations in income have no effect on female labor supply behavior. In any event, because Heckman and MaCurdy do not really confront the short-run dynamics of aggregate female labor force participation, it is difficult to relate their research to the substitution hypothesis.

In light of the studies of labor supply just discussed, what might an ideal test of the substitution hypothesis look like when micro data are involved?<sup>13</sup> First, it would surely need to produce econometric estimates of how individuals' short-run (say quarterly) employment-unemployment decisions respond to *unexpected cyclical* variation in their real wages. These micro labor supply relationships for various demographic groups would then have to aggregate into an economy-wide short-run response of employment to cyclical movements in the average real wage that, based on our earlier "back of the envelope" calculations, has an elasticity of at least +2.0. Identifying these underlying short-run micro labor supply functions is difficult with most existing data, which often just record individuals' annual totals for the relevant variables (in other words, the individual's decision-making period may diverge from the period to which the data relate); however, because monthly observations are available from the recent negative income tax experiments, it may be possible to use these data to examine the short-run labor supply (employment) decisions of low-income household members over the business cycle.<sup>14</sup> In light of their eligibility for income support payments, low-income workers seem the most likely candidates to follow the behavior described by the substitution hypothesis. Should we fail to find support for the

<sup>11</sup> Mark Killingsworth (1983, Ch. 3-5) is a useful survey of this literature.

<sup>12</sup> Moreover, MaCurdy (1983) estimates a set of utility function parameters for low-income men that imply unbelievably large static labor supply elasticities. While the reasons for this result are not readily apparent, he speculates that they stem from the strong a priori restrictions necessary for identification when uncertainty is present and from the difficulty involved in statistically separating the effects of budget constraint shifts from utility function shifts within an intertemporal setting. Of course, this is the very essence of testing the substitution hypothesis.

<sup>13</sup> We thank Jim Heckman for some useful insights on this issue; also see Heckman (1984).

<sup>14</sup> See Jean Kimmel (in progress).

substitution hypothesis in these data, it seems unlikely we will find the needed empirical support elsewhere.

### B. Evidence Focusing on the Role of Labor Demand

Having previously discussed the effect of a recession on the aggregate labor supply and demand schedules, let us now consider a business cycle expansion. In particular, let there be an increase in aggregate product demand that shifts the aggregate demand for labor from  $D$  to  $D'$  in Figure 5, where the nominal wage is measured on the vertical axis, and the price level is being held fixed as we move along the labor supply or demand schedule. The initial result is excess demand and job vacancies of  $N(1) - N(0)$ . Employers must now compare the relative costs and benefits of increasing their labor force versus seeking additional hours from existing employees.

The choice of how to vary the labor input depends upon the firm's forecast of future economic events as well as on the confidence they have in the accuracy of these forecasts (George Stigler 1939). Uncertainty over the future first leads firms to change hours of work per worker when the demand for their product and therefore labor shifts (M. Ishaq Nadiri and Sherwin Rosen 1969). Because of the fixed costs involved, such as hiring and training costs associated with changing the number of workers, an employment change will be the predominant adjustment only after employers conclude that the demand shift is more than just temporary.

Refocusing our attention on an economic expansion, within the Walrasian framework an attempt on the part of employers to secure additional labor services, leading to excess labor demand, will be accompanied by an increase in the nominal wage if the aggregate labor supply schedule is not infinitely elastic.

Figure 5. The Labor Market Effects of a Cyclical Increase in Demand

Although an expansionary demand shock of the type we have been discussing should increase the nominal wage, its effect on the real wage depends on the root cause of the increase in aggregate labor demand. For example, if the shift from  $D$  to  $D'$  in Figure 5 stems from an increase in product prices, then the change in the aggregate real wage depends on the variation in the nominal wage relative to the variation in the aggregate price level. If, however, changes in product price are not responsible for the increase in aggregate labor demand, then the real wage increases. Thus, the Walrasian model applied to aggregate outcomes yields unambiguous predictions regarding the impact of demand-side volatility on aggregate labor utilization and the nominal wage, but not on the real wage.

In any event, the ultimate increase in the money wage in an aggregate auction market for labor reduces the extent of excess demand and the requisite change in total labor services necessary to reestablish equilibrium. The new Walrasian equilibrium is point C in Figure 5. No-

tice that if the wage response to excess demand is incomplete, less than  $W(1) - W(0)$ , then the change in labor services utilized (supplied) is less than if wages are more flexible, that is, if they rise all the way to  $W(1)$ .

As a final background comment it should be mentioned that the elasticity of labor demand with respect to the wage rate could itself vary over the business cycle. Clearly, a procyclical wage elasticity would exacerbate the labor shortage associated with expansion and moderate the labor surplus during a business cycle contraction. Allan Drazen, Daniel Hamermesh, and Norman Obst (1984) develop a model where the wage elasticity of labor demand is lower for a sales-constrained firm than for an unconstrained firm. Because they assume that the proportion of firms facing sales constraints increases when aggregate economic activity declines, Drazen et al. expect a procyclical wage elasticity of aggregate labor demand. They use several different data sets, including quarterly time-series for U.S. manufacturing, to test this hypothesis and find weak support for it.

1. *Fluctuations in Output.* It is a useful empirical exercise at this point to refocus on whether wages, employment, and unemployment respond to fluctuations in demand-side factors in the general directions suggested by the neoclassical model applied to aggregate manufacturing data.<sup>15</sup> Robert Gordon (1982) uses postwar quarterly data on manufacturing workers in the United States (as well as the United Kingdom and Japan) to esti-

mate the associations among changes in wages, employment, hours of work, and nominal GNP. These variables are measured as four-quarter overlapping rates of change for the periods 1962-72 and 1963-80. During each period the variability of both employment and hours of work, measured by the standard deviation of the four-quarter percentage rate of change, substantially exceeds the variability of the nominal wage in U.S. manufacturing. More specifically, the two measures of labor utilization in manufacturing are at least 60 percent more variable than the manufacturing nominal wage. Gordon also examines the association between the money wage and changes in nominal GNP, the latter interpreted as reflecting the variability of aggregate demand.<sup>16</sup> His findings suggest that a 10 percent change in the growth rates of nominal GNP in the current and preceding eight quarters leads to only a 1.1 percent change in the growth rate of the current nominal manufacturing wage. This suggests that the response of the manufacturing wage to changes in nominal GNP is relatively small.<sup>17</sup>

Robert Gordon's finding, that the

<sup>16</sup> To see this, think of the standard three-market (labor, money, and commodities) neoclassical macroeconomic model. The level of employment established in the aggregate labor market, in conjunction with the aggregate capital stock, determines real output and the aggregate supply of goods and services. Aggregate demand links the economy-wide price level to real output given equilibria in both the money and commodity markets. Because real output can be thought of as fixed by the labor market, fluctuations in the equilibrium price level (and thus in nominal GNP) reflect disturbances in aggregate demand.

<sup>17</sup> It is important to clarify the differences and similarities between the results in Table 1 and those in this paragraph. Table 1 covers the entire postwar period with annual economy-wide observations. In addition, the elasticity estimates in Table 1 link labor market outcomes to real, not nominal, GNP. Finally, despite the differences in the signs on the respective GNP variables, both sets of results indicate relatively small responsiveness of the various labor market outcomes to changes in GNP.

<sup>15</sup> We must be careful not to overgeneralize results from quasi-aggregate studies of a large industry such as manufacturing, though. There is much interindustry heterogeneity where cyclic movements in real wages and employment are concerned, and a researcher may therefore derive a much different picture from examining manufacturing (or another one-digit industry) compared to the economy as a whole. For elaboration see Thomas Coleman (1984, pp. 8-89).

cyclic volatility of the aggregate labor input in manufacturing greatly exceeds the (small) cyclic volatility of the nominal wage, is inconsistent with the conceptualization of the manufacturing labor market as an auction unless both the labor supply curve and labor demand curve are highly elastic. We know of no evidence that would suggest this is the case. For example, Drazen, Hamermesh, and Obst (1984) report that the wage elasticity of labor demand in U.S. manufacturing is well below unity, even when it is permitted to be procyclical. When coupled with Robert Gordon's finding, this casts serious doubt on the applicability of the economist's standard auction model to the cyclical operation of the aggregate manufacturing labor market.

This conclusion is reinforced by James Brown (1982), who uses annual manufacturing data for 1954–78 to analyze the relative variability of labor market outcomes. Simply put, the more closely and quickly the nominal wage mimics the variation in the value of labor's marginal product over the business cycle, the more one might say a simple neoclassical labor market underlies the data. Brown finds an elasticity of annual earnings per production worker with respect to annual aggregate marginal value product of labor in U.S. manufacturing of only about 0.3. When he respecifies the model to include lagged measures of labor's marginal value product as independent variables, Brown estimates a long-run elasticity of earnings per worker with respect to marginal value product in manufacturing near unity. These parameter estimates imply that it takes seven years for manufacturing earnings to reflect a labor demand disturbance fully. Because business cycles typically run two to three years, this result would seem to provide little support for the spot auction characterization of the manufacturing labor market. A seven-year adjustment process may in-

stead be signaling a long-term contract between workers and firms; such labor market arrangements are the focus of Section IV.

### *C. Evidence Focusing on the Interaction of Labor Supply and Demand*

1. *Real Wages in the Great Depression.* Nominal wages fell 18 percent in manufacturing and 21 percent overall during 1929–33 (Martin Baily 1983); however, the real wage increased by about 8 percent overall and 11 percent in manufacturing during this period as the consumer price index declined by about 29 percent. Moreover, both the real and nominal wages increased during 1933 to 1937, even though the unemployment rate averaged almost 20 percent during this time. In particular, real compensation in manufacturing climbed approximately 26 percent, while workers overall realized a real compensation increase of about 11 percent. Baily attributes a portion, but not all, of these sharp increases in the real wage to institutional phenomena, such as union growth and the National Industrial Recovery Act. Alternatively, Ben Bernanke (1986) modifies the conventional neoclassical model of the firm to account for rising real wages during the Great Depression.

As noted earlier, firms can vary not only the number of workers and machines they employ but also the hours per period that these workers and machines work. In addition, as Bernanke points out, the labor supply to the manufacturing sector is conditional on the nominal wages in the nonmanufacturing sector and the value of individuals' leisure time. Profit maximization in turn implies that firms are likely to react to depressed product demand with both employee layoffs and work sharing. The decline in the demand for weekly hours will therefore have an ambiguous effect, *ex ante*, on the average real weekly wage.

The average real wage could actually rise as average weekly hours fall. Intuitively, if workers have a reservation level of earnings then firms are deterred from cutting earnings in exact proportion to the cut in hours of work. In this way, an increase in the average hourly wage is necessary to cushion the hours reduction, lest workers quit because earnings fall below some reservation level.

Bernanke estimates monthly labor supply and labor demand equations for eight different manufacturing industries during January 1923 to December 1939. As expected, the estimated effect of cyclic changes in output on both equilibrium employment and hours of work is positive and statistically significant. He also reports an elasticity of monthly earnings with respect to monthly hours of less than one. This implies the (observed) countercyclical real monthly wages noted above.

To conclude, while Bernanke offers an explanation for countercyclical real wages during the Depression that complements Bailey's institutional explanations, his model assigns employers a degree of control over hours worked that they may not have. Moreover, such employer power seems to us to be more indicative of a long-term contract whereby workers give up short-term control of their work hours in exchange for earnings that are somewhat cushioned from business cycle shocks.

2. *Layoffs and Quits in the Great Depression.* The magnitude and composition of unemployment during 1929 to 1945 may shed some additional light on the applicability of the neoclassical model of the labor market. In particular, are the high unemployment levels largely the result of layoffs accompanied by an increase in worker quits, as we would expect in an auction market for labor? The answer to this question, as we will see in the next paragraph, is no.

The layoff rate in manufacturing was

very high during 1930–32, averaging about 4 per 100 workers per month, and the monthly layoff rate was persistently high throughout the 1930s, averaging just over 3 percent during 1933–37 and 2.7 percent during 1938–41. On the other hand, the monthly quit rate, which averaged 1.3 percent during 1930–32, fell slightly to 1.2 percent during 1933–37 and declined more noticeably, to 0.96 percent, during 1938–40. (See *Historical Statistics of the United States*, p. 181.) The inverse relation between layoffs and quits is highlighted by the month-to-month changes occurring in these series during 1929 (W. S. Woytinsky 1942). In particular, employment declined dramatically during August, and the first signs of a downturn can be traced to the substantial decline in the rate of hiring that also occurred during August. In September the layoff rate began to rise and the quit rate fell. By December the layoff rate was almost three times that of its January to July average while the quit rate was approximately one-half of its average for the first seven months of 1929. According to Baily (1983, p. 31), “. . . workers realized very quickly that alternative job opportunities had deteriorated.”

3. *Real Wages and Employment in the Postwar Period.* A number of studies examine the cyclicity of the average economy-wide real wage in the postwar period with conflicting results. Ronald Bodkin (1969), Salih Neftci (1978), and Alan Stockman (1983) find a procyclical aggregate real wage in the United States; Thomas Sargent (1978) concludes that the real wage is countercyclical; and Patrick Geary and John Kennan (1982) and Thomas Coleman (1984) find an absence of any cyclicity. Along these lines, Coleman extensively analyzes postwar aggregate data noting that the conclusion to be drawn concerning the cyclicity of the aggregate real wage depends cru-

cially on the sample period (also see George Kahn 1984). After dismissing Sargent's countercyclical result because of a lack of robustness, Coleman concludes that the aggregate real wage was acyclical during the postwar period. An exception to this is the decade of the 1970s, when it was procyclical as energy price shocks led to a recession, rising prices, and a falling real wage. Thus, researchers who find a procyclical real wage tend to be examining periods dominated by the 1970s.

More recent research on real wages over the business cycle uses individual data to examine whether the conclusions drawn from aggregate data are perhaps altered when the researcher considers that the business cycle can affect sample composition. Let us elaborate. Cyclic fluctuations in the aggregate real wage are dampened if recessions cause relatively low-wage workers to lose employment while macroeconomic expansions lead them to gain employment. On the other hand, this effect can be more than offset by relatively high-wage workers moving into relatively low-wage jobs during recessions and by relatively low-wage workers moving into relatively high-wage jobs during macroeconomic expansions (James Heckman and Guilherme Sedlacek 1985). In this way, cyclic movements in the aggregate real wage can actually be amplified by employment composition effects. These issues are addressed in Stockman (1983), Mark Bils (1985), Coleman (1984), and Michael Keane, Robert Moffitt, and David Runkle (1986). The basic conclusion emerging is that the results from the aggregate data summarized in the last paragraph remain intact; sample composition effects are empirically unimportant for the issue. The real wage is acyclical in the postwar period, except for the 1970s when it is procyclical for the reasons mentioned earlier in this section.

Martin Weitzman (1984, 1985) addresses the real wage rigidity we have been discussing with an eye to a policy recommendation. In particular, he suggests an alternative compensation scheme characterized by a greater degree of aggregate real wage flexibility (than we currently have) to mitigate the use of layoffs by employers during an economic slowdown. What Weitzman recommends is a pay system more like that of many workers in Japan who, in addition to their regular wage, receive a biannual bonus that is tied to the firm's profits. If U.S. workers would somehow accept such an arrangement to a greater degree than they now do, then wages would be more flexible downward during a recession in turn mitigating the decline in employment sought by profit-maximizing firms. By getting wage flexibility "through the back door," the share system would exhibit greater macroeconomic stability.

Weitzman likens the problem of recession-induced layoffs to that of pollution externalities because individual agents do not have an economic incentive to consider the economy-wide implications of the pay scheme they adopt; however, he largely ignores either the possibility of self-employment or the fact that under a wage system the youngest, most mobile, workers are often the ones primarily exposed to cyclical unemployment as layoffs tend to be based on seniority or work experience. Workers concerned with stabilizing their real earning power in the latter part of their working lives will prefer rigid real wages and a comparatively small risk of a job loss due to a layoff (with income supplemented by unemployment compensation) to wages that regularly fluctuate over the business cycle, which would be the case under a share system of compensation. In light of such life-cycle considerations and risk factors, which Weitzman generally ig-

nones in evaluating the merits of a share system versus a (rigid) wage system, is social welfare clearly greater if we convert to a compensation arrangement whereby all workers accept greater lifetime income variability in order to stabilize the employment of a relatively few newer workers?<sup>18</sup> We contend that the answer to this question is *no*. While a rigid real wage may have the undesirable property of magnifying the use of layoffs during an economic downturn, economists should hesitate to label this a sub-optimal situation and remember that the wage system has been chosen by most firms and workers in the United States.

More to the main point of this review, however, is that an acyclic aggregate real wage means that for a theoretical model of the aggregate labor market to be taken seriously it must imply at least approximate independence between the aggregate real wage and employment—a procyclical variable. This is really not very restrictive because in an auction-market setting with both labor supply and demand schedules subject to random disturbances, real wages and aggregate employment may easily be uncorrelated. As Kennan (1983) and Seater (1985) emphasize, we need to know more about the determinants of cyclical shifts in aggregate labor supply in order to judge the empirical performance of an equilibrium model properly. Along these lines, Kennan (1983) develops a set of equilibrium labor market models characterized by a common labor demand specification but containing alternative labor supply function specifications. His research goal is to determine which model, if any, produces time-series hypotheses concerning the aggregate real wage and employment

that are consistent with postwar U.S. data for manufacturing.

In each of Kennan's models labor demand follows a partial adjustment scheme coupled with one of three different labor supply structures: (i) current labor supply depends on the quantity supplied in the previous period and on a geometric average of expected future real wages, (ii) current labor supply depends on the current real wage and on the expected permanent real wage, or (iii) current labor supply depends on a contractual arrangement between workers and firms such that during a worker's tenure wages are smoothed over business cycles.

Kennan estimates the three models outlined above with monthly data on total employee hours worked and real wages for production workers in U.S. manufacturing during 1948 to 1971. His most interesting empirical result is that fluctuations in employee hours do not appear to cause (lead) real wage changes, while real wage disturbances appear to cause (lead) fluctuations in total employee hours. In other words, real wages and employee hours do not appear to be jointly determined for manufacturing production workers. Instead, movements in employee hours in manufacturing appear to be induced by prior changes in real wages. Although his parameter estimates are sensitive to the sample period (and occasionally are implausible in magnitude), Kennan's primary empirical result is that the comovement of total employee hours and the real wage in manufacturing is sluggish and that the model including both long-term contracting and wage smoothing (labor supply specification (iii) above) is the preferred one.

To conclude, the fact that the various behavioral implications of the conventional neoclassical labor market model so frequently conflict with the economy-

<sup>18</sup> In Section V we discuss some recent attempts to build a labor market model incorporating the distinction between new and relatively experienced workers.

wide or aggregate manufacturing data for the United States casts serious doubt on the empirical acceptability of that conceptual framework. Attempts described in this section to reformulate the neoclassical labor market model are refreshing and could be viewed as implying that a well-specified auction model of the aggregate labor market is closer to the "cradle" than to the "grave."

### III. Disequilibrium Analysis

In Figure 6, the straight line  $ABD'$  is the standard labor demand schedule, which has also been called the notional demand for labor. Now suppose that the economy has just entered a recession, so that the real wage must fall to  $w(0)$  in order to restore full-employment equilibrium, which is where notional demand equals the notional (standard) supply of labor schedule,  $S$ . The essence of so-called labor market rationing is that in a recession firms may determine that they are able to sell no more than a given level of output, call it  $Q(1)$  (Robert Clower 1965; Robert Barro and Herschel Grossman 1971; Edmond Malinvaud 1977; Drazen 1980). As a result, only employment level  $N(1)$  can be sustained. In terms of Figure 6, the effective demand for labor is only  $ABN(1)$  so that at (the assumed to be rigid) wage  $w(0)$  employment is only  $N(1)$ . One result of this is cyclical unemployment equal to  $N(0) - N(1)$ .

Models of rationed work opportunities are an attempt to release empirical labor market analysis from the "strait jacket" of an auction, primarily because the garment does not seem to fit the "patient." Labor market rationing may exist because prices (and presumably wages) are difficult to set correctly so that firms make quantity (output and employment) adjustments rather than price (product price and wage) adjustments. A model

Figure 6. Rationed Work Opportunities and Cyclical Unemployment

of the labor market where work opportunities may be rationed can be consistent with many of the empirical phenomena observed during U.S. business cycles, including countercyclical layoffs and procyclical employment movements paired with real wages that are relatively insensitive to aggregate fluctuations. It also permits the existence of large-scale cyclical unemployment. We now turn our attention to the empirical research in this area.

#### A. Evidence Focusing on the Role of Labor Supply

When work opportunities are rationed unemployment is part of desired labor supply—workers would like to be employed at the going wage rate but their offers are not accepted by firms. As a result, many empirical studies of rationing as an explanation for cyclical unemployment have focused on testing the hypothesis that unemployment is part of desired employment. It is also possible to confront the rationing issue by making use of survey information on workers who report employment restrictions directly to infer the importance of these perceived restrictions. We now

discuss each of these approaches to studying labor supply constraints in turn.

1. *Unemployment as Part of Desired Labor Supply.* Ashenfelter (1980) treats unemployment as a possible exogenous constraint on labor supply in a one-period static model of aggregate consumption and work behavior. He assumes that desired hours of work are the sum of observed work and some unknown fraction,  $a$ , of time unemployed during the decision period. This is described by equations (1) and (2), below.

$$N(t)^* = N(t) + aU(t), \quad (1)$$

where  $N(t)^*$   $\equiv$  desired hours of work,

$N(t)$   $\equiv$  actual hours of work,

$U(t)$   $\equiv$  hours of unemployment,  
and

$a$   $\equiv$  the proportion of time  
spent unemployed that  
the individual desires to  
work in the labor market.

Rearranging (1) and adding a random disturbance term,  $e(t)$ , yields

$$N(t) = N(t)^* - aU(t) + e(t). \quad (2)$$

In Ashenfelter's equation (2) the individual's unemployment spell,  $U(t)$ , is exogenous. This means that hours of unemployment in period  $t$  become an independent variable in the labor supply equation explaining the individual's current observed hours of work,  $N(t)$ . Analogously, the aggregate unemployment rate becomes an independent variable in an aggregate labor supply function.

With the appropriate caveat that Ashenfelter's estimates show sensitivity to estimation technique and the assumed properties of  $e(t)$ , we note his results that only during the Great Depression does an unemployment constraint seem to be affecting aggregate hours of work. In particular, Ashenfelter estimates the parameters of both a constrained and unconstrained aggregate labor supply-con-

sumption system. The parameters of the two models differ essentially only during the Great Depression. In other periods Ashenfelter concludes that the auction-market framework is preferred. This is based on the Law of Parsimony, whereby when two theories perform equally well empirically, the simpler one is preferred.

It is difficult to accept the maintained hypothesis that unemployment is a surprise to the worker, though. Ashenfelter and John Ham (1979) weaken this background assumption somewhat by considering the possibility that an individual may foresee future unintended unemployment. This foresight is in turn reflected in the parameters of the labor supply equation, including during periods when the (exogenous) unemployment constraint is not actually in effect. The basic theoretical implication of such a situation is that labor supply constraints will cause a redistribution of work to unconstrained periods. As before, the empirical "twist" in this research is the use of unemployment as an independent variable in a labor supply equation. To be more specific, Ashenfelter and Ham entertain two cases: one specification of the labor supply function in which the unemployment constraint is anticipated and one in which it is unanticipated. Specification tests with micro data for prime-aged males suggest that periods of unemployment go unforeseen and that hours of unemployment is an endogenous variable so an econometric framework recognizing this is probably required.

The empirical literature that attempts to incorporate observed unemployment into an estimated labor supply function and to use the resulting parameters to infer the (in)voluntary nature of that unemployment suffers from a number of conceptual and operational defects. If the individual takes an active role in determining his or her unemployment experience, then the duration of unemploy-

ment is part of the optimal allocation of time (Heckman, Killingsworth, and MaCurdy 1981; Pencavel 1986). The econometric model should then take this possible endogeneity into account. Moreover, the substitution hypothesis implies not only that unemployment experience is endogenous but also that it is embedded in a life-cycle context.<sup>19</sup> In the next section we consider research that confronts the rationing issue more directly by using survey information on workers who report themselves as restricted in their labor market choices. In some cases, the empirical work that takes this tack also tries to confront the research problems raised in this paragraph.

2. *Using Survey Data on Labor Market Constraints.* Ham's (1977) econometric analysis of individual labor supply incorporates sample information on men who report they are working more or fewer hours than they would like to work. The issue can be clarified by looking at the three points in Figure 7, which illustrates the three possible categories—overemployment, underemployment, and equilibrium—into which a man may report himself.<sup>20</sup> Of course, any self-reported interpretation of an economic situation must be viewed with caution. With this in mind we note that Ham's primary research goal is to compare two sets of labor supply parameter estimates—(i) those emerging when the data are preclassified into the three groups described in Figure 7 and (ii) those based on the usual *ex ante* assumption that all workers are at an equilibrium tangency position described by point A in Figure 7. Ham finds that the two sets

Figure 7. Overemployment, Underemployment, and Auction-Market Equilibrium

of parameter estimates imply similar responses of hours of work to changes in wages and unearned income. Such a conclusion also emerges from Ham (1982).

In closing, we noted earlier that a number of economists have strongly criticized the research on rationing because of the assumption of exogenous unemployment. The essence of the issue is that if hours of unemployment,  $U(t)$ , are determined by the individual jointly with his hours of work,  $N(t)$ , then ordinary least-squares estimates of  $a$  in Equation 2 are inappropriate and a simultaneous equation procedure is required to account for the endogeneity of  $U(t)$ . The application of such a simultaneous equation procedure requires instrumental variables that help to determine  $U(t)$  but that are unrelated to the individual's hours of work,  $N(t)$ . (See Ham 1983, 1986 for elaboration.) In our judgment, this procedure cannot be realistically implemented because everything that affects desired labor supply should also affect the individual's unemployment experience, and vice-versa. Simply put, it would be an

<sup>19</sup> For elaboration see Thomas Knesner and Arthur Goldsmith (1985, pp. 215–21).

<sup>20</sup> Calculations we have made with Ham's data set, the University of Michigan's Panel Study of Income Dynamics, reveal that 29 percent of the men experienced at least one year with some overemployment and 67 percent experienced at least one year with some underemployment.

odd labor market indeed where an exogenous variable that affects unemployment, through say layoffs, does not affect hours worked by the employed. (For more discussion see Pencavel 1986.)

This completes our discussion of empirical research that attempts to test for constraints on the supply of labor. We now turn our attention to whether econometric research that includes a role for labor demand in conjunction with labor supply improves our understanding of this gap.

#### B. Evidence Focusing on the Role of Labor Supply and Demand Together

Many older empirical studies of labor market disequilibrium focus on differences between actual and desired input quantities (Nadiri and Rosen 1969). In these models employers suffer costs from being out of equilibrium, and adjustment toward an optimum requires additional costs. As a result, one expects partial adjustment by a firm to its employment equilibrium. To test this hypothesis, researchers then specify a model of partial adjustment with a coefficient that measures the fraction of any disequilibrium eliminated during a given period of time. This estimated adjustment coefficient allows inferences regarding whether disequilibrium exists. Specifically, if the estimated adjustment coefficient is unity, no gap between actual and optimal input use ever obtains.

Other research on disequilibrium presents a different type of disequilibrium model (Barro and Grossman 1971; Ray Fair and Dwight Jaffee 1972). Here markets are characterized by equilibrium, excess supply, or excess demand. In equilibrium, the quantity bought and sold is determined by the intersection of the supply and demand curves. Disequilibrium theory suggests that the quantity observed is the minimum of the quantity supplied and quantity demanded at the current wage. As a result,

Figure 8. A Labor Market with Disequilibrium

observed employment is: (i) on the supply function if the quantity of labor demanded exceeds the quantity supplied or (ii) on the demand function if the quantity of labor demanded falls short of the quantity supplied. This situation is depicted in Figure 8 by the heavily shaded segments of  $S$  and  $D$ , respectively.

1. *A Primer on Disequilibrium Models.* One way to shed light on the issue of whether a labor market clears is first to estimate separately an equilibrium model and a disequilibrium model and then determine which of the two is a better empirical representation of observed labor market outcomes. Of course, there is some disagreement over the best way to estimate the disequilibrium model (G. S. Maddala 1986).

An alternative procedure is to use qualitative information on wage changes to infer whether data sort into a period of excess demand or excess supply. Specifically, when the real wage falls, this can be interpreted as a period of excess supply of labor; when the real wage rises, this can be interpreted as a situation of excess demand. (Observations for which there is no change in the wage may be allocated to either category.) Labor supply and demand functions are then esti

mated separately using the observations judged as lying on that particular schedule. For example, those observations on wages and employment corresponding to excess labor demand ( $a_1$ ,  $a_2$ ,  $a_3$ ,  $a_4$ , and  $a_5$  in Figure 8) can be used to estimate the labor supply function, while those observations corresponding to excess labor supply ( $b_1$ ,  $b_2$ ,  $b_3$ ,  $b_4$ , and  $b_5$  in Figure 8) can be used to estimate the labor demand function. This technique is known as a switching regression model because it characterizes labor market data as switching between periods when observations map out the labor demand function and periods when they trace out the labor supply function. (See Maddala 1986 for a more technical discussion.)

In any case, whether a more standard (say, partial adjustment) approach or the switching technique is adopted to estimate the disequilibrium model, the key issue remaining is how to judge the empirical performance of a disequilibrium model versus one that characterizes all observations on wages and employment as lying at the intersection of supply and demand.<sup>21</sup> The literature contains three ways to make such a judgment. First, one can construct a test statistic for the null hypothesis that the aggregate labor market is always in equilibrium against the alternative that it is not. Second, one can compare the signs and magnitudes of the estimated parameters from the two alternative models with each other and

with their expected values. Third, one can use the estimated coefficients from the two respective models to forecast unemployment and then compare these forecasts with actual unemployment data.

Of course, underlying any attempt to judge the relative empirical performance of an equilibrium versus disequilibrium model is the specification of the structural equations. By design, the structural equations of the two respective models tend to be quite similar. The typical specification of the labor market equilibrium model entails a labor demand equation (represented by an expression for the marginal productivity of labor), a labor supply equation (expressed as a function of the real wage rate and unearned income), and an equation describing the quantity of labor firms utilize (which is the standard reduced-form equation for the equilibrium quantity of labor in a supply-demand system). Four equations typically make up the labor market disequilibrium model. The labor supply and demand expressions are identical to those of their equilibrium counterpart; the other two equations describe the quantity of labor firms use and the real wage adjustment process. More specifically, the quantity of labor services employed is usually the minimum of labor supply and demand, and real wage movements usually depend on excess labor demand and noncompetitive factors. More complex disequilibrium models than this do exist, though, and a few are worthy of further mention.

Glenn Rudebusch (1986) incorporates prior information on the extent of labor market excess demand, including help-wanted advertising, and allows both labor supply and demand to follow partial adjustment schemes. Even more complete is the model development in Harvey Rosen and Richard Quandt (1985) which, among other things, allows prices to be endogenous, accounts for the ef-

<sup>21</sup> A related issue is that the annual unemployment rate is always positive. This could leave the impression that excess supply of labor is chronic. If this were the case, then all wage and employment observations lie on the labor demand curve. Therefore, using a sophisticated estimation technique, such as a switching regression model, would be unnecessary because only labor demand need be estimated. Richard Quandt and Harvey Rosen (1985a), using annual observations on the U.S. economy for 1969-79, reject the hypothesis of chronic excess supply in the aggregate labor market. This result suggests that a switching regression is the more appropriate way to estimate the parameters of an aggregate labor market model.

fects of past wage and price changes on the current nominal wage, utilizes unemployment data to help identify an excess demand for labor situation, and lets some of the error terms be serially correlated. Finally, Vassilis Hajivassiliou (1986) broadens the typical analysis to address the issue of multimarket (dis)equilibrium. His model permits some sectors to have excess demand for labor while others have excess supply. Movements in aggregate employment are in turn related to the proportion of markets in excess demand versus those in excess supply.

Having gained a little general theoretical background into disequilibrium models of the aggregate labor market we now examine the evidence concerning their empirical performance.

2. *The Relative Empirical Performance of Disequilibrium Models.* Estimated parameters of the disequilibrium models just described, regardless of the specification or manner in which they are estimated,<sup>22</sup> are usually consistent with a priori expectations. More specifically, because Rosen and Quandt (1978) and Quandt (1983) estimate both equilibrium and disequilibrium models, they are able to construct a likelihood-ratio test of the equilibrium hypothesis. Both studies reject the null hypothesis that the labor market is always in equilibrium. Moreover, Romer's traditional disequilibrium specification<sup>23</sup> as well as the forward-looking disequilibrium model adopted by

Jonathan Eaton and Quandt (1981)<sup>24</sup> generate plausible predicted values for the unemployment rate over the sample period. For example, the simple correlation between the unemployment rate predicted by Romer's model and the annual unemployment rate exceeds 0.9 for the period 1930–73. Similarly, the more elaborate disequilibrium models of Hajivassiliou (1986), Rosen and Quandt (1985), and Rudebusch (1986) generate very accurate predictions of labor market outcomes. For instance, when Rosen and Quandt (1985) regress the actual value on the predicted value for each of the endogenous variables in their model, the resulting  $R^2$ 's fall in the range 0.911 to 0.997.

The empirical results in the studies discussed in this section show that a disequilibrium model can track aggregate labor market outcomes quite well. This conclusion cuts across a variety of model specifications, estimation techniques, and evaluation criteria. Most importantly, it appears that an econometric representation of the aggregate labor market that allows for frequent disequilibrium is clearly preferred to an equilibrium representation.<sup>25</sup> Suppose that we accept a finding of frequent disequilibrium in the aggregate labor market. A logical question to ask next is what might be the cause of it? Some economists say it is transaction costs that lead to sluggish real wage adjustments when labor supply or demand is disturbed.

3. *Transaction Costs and Wage Changes.* Proponents of the transaction costs argument emphasize that firms' de-

<sup>22</sup> In general, the data used are economy-wide annual averages beginning in 1929. Exceptions are Hajivassiliou (1986) and Rudebusch (1986), who use aggregate postwar quarterly data.

<sup>23</sup> Romer (1981) revises Rosen and Quandt's (1978) disequilibrium model by discarding their assumption that nonlabor income is exogenous in the labor supply equation and instead drops nonlabor income from the model. The logic behind this is that, while the appropriate model incorporates saving decisions, data limitations prevent treating nonlabor income as endogenous.

<sup>24</sup> Eaton and Quandt (1981) also estimate the Rosen and Quandt (1978) disequilibrium model after re-specifying the labor supply equation. They add the wrinkle that aggregate labor supply may be influenced (reduced) by the possibility that the labor market will have future excess supply.

<sup>25</sup> Readers desiring additional discussion of this conclusion with a cross-national focus should consult Malinvaud (1984).

cisions to change the nominal wage are not made lightly. As a result, real wages may not adjust quickly enough to prevent cyclical unemployment. Moreover, it takes time for workers to observe new employment opportunities or the lack of them and to adjust their labor supply accordingly. For example, workers need time to alter their labor market expectations and to drop out of the labor force or to accept employment that was previously refused (Milton Friedman 1968). It also takes time for firms to assure themselves that a particular economic event merits a wage response. Employers associate substantial costs with frequent wage adjustments (Albert Rees 1970). Most of the direct and indirect costs associated with administering wage changes are evident; however, certain indirect costs are not readily apparent and are difficult to quantify. Nonetheless they must be accounted for to understand why employers often resist wage changes. For instance, wage changes can raise troublesome questions of internal equity that may adversely affect a firm's labor productivity.

The transaction costs explanation of cyclical real wage rigidity and unemployment is certainly plausible. It is hardly controversial to argue that changes in intended labor supply or demand may take a number of months, possibly even a year, to be implemented because of adjustment costs; however, a major obstacle to testing the hypothesis that real wages are rigid as a result of slow nominal wage adjustments on the part of firms or slow labor supply adjustments on the part of workers is that several key variables are latent, including transaction costs themselves. In the remainder of this section we describe some attempts to implement empirically a transaction cost model of the labor market.

The papers by Pencavel (1982) and Louis Christofides (1985) represent, to

our knowledge, the first careful empirical attempts to consider transaction costs when investigating labor market outcomes. Because of the costs associated with altering wages, such transaction costs may influence not only the frequency of wage changes but also the magnitude of wage settlements (Rees 1970). Pencavel considers the possibility that, because of transaction costs, a variable may affect the likelihood of a wage change without necessarily affecting the magnitude of the change. He tests this hypothesis with quarterly data on the British coal industry for 1948-75 and finds, for example, that an increase in the rate of change of consumer prices significantly enhances the likelihood of a nominal wage change in the British coal industry; it does not influence the extent of that wage change, though.

Transaction costs are largely a latent variable in Pencavel's empirical model. Although they are accorded a fundamental theoretical role by Christofides, transactions costs are still not totally explicit in his empirical examination of incomes policies and union wage contract duration in Canada. Christofides' focus is on the maintained hypothesis that contract duration and transaction costs are positively related. He uses the duration of past contracts as a surrogate for current transaction costs and therefore argues that relatively long previous contracts should lead to relatively long current contracts. Christofides tests this hypothesis with quarterly data on Canadian labor union contracts during 1966-81. As expected, coefficients on past contract length are positive and indicate a statistically significant effect on the length of the current contract agreement.

The research described in the last two paragraphs illustrates the difficulties associated with trying to implement a model of the aggregate labor market affording transaction costs a major role. A

similar difficulty has been noted with attempts to introduce the costs of transacting into the analysis of households' behavior. Robert Pollak (1985, p. 606) writes, "A principal defect of the transaction cost approach is its failure to provide a structure for rigorous econometric investigations. Developing such a framework requires incorporating the insights of the transaction costs approach into formal models and specifying such models in sufficient detail to permit their estimation." In the case of labor market research the problem has not been the detail of the theoretical models, but rather the almost total lack of any credible measure of the transaction costs themselves. It will probably be a long time before the data become available (if ever) to implement a detailed empirical model of the aggregate labor market where the observed cyclical behavior of participants is explicitly linked to transaction costs.

4. *Where Does the Research on Disequilibrium Lead Us?* The research discussed in this section suggests frequent labor market disequilibrium resulting in involuntary cyclical unemployment. While rigid real wages may be responsible, efforts to dig more deeply into the reasons for this rigidity are in their empirical infancy. Perhaps as a sign of their frustration, researchers frequently just assume that wages are rigid without stating a reason. The main objective of research on the labor market should be to establish a model where unemployment and rigid wages are jointly endogenous, though (Drazen 1980). Along these lines, what appears to be employment rationing may be the result of calculated decisions by employers, in conjunction with their work force, rather than some exogenously imposed phenomenon. If workers consent to a labor market relationship where their employment may frequently differ from what they would most like to supply at the current real wage, then

an incentive for long-term contracting between workers and firms exists. Thus, the evidence pointing us away from an auction market for labor seems to be pointing us toward the possibility of long-term labor market contracting.

#### IV. *Long-Term Contracting*

The twentieth century has witnessed a radical transformation of the American work environment (Donald Parsons 1986). The average size of the workplace increased markedly while the portion of the work force self-employed declined from almost 50 percent in 1900 to about 8 percent today. Parsons argues that, "As the size of the workplace grew, the need for explicit and implicit employment contracts to define and regulate the employment relationship grew correspondingly." So, while there seems reason to believe that theoretical models of long-term labor market contracts may shed important light on the cyclical covariation of wages, employment, and unemployment, such models must face the same stringent test we applied to the others discussed earlier. Specifically, can an explicit or implicit contract model imply the observed business cycle variations in wages (un)employment in the United States?

##### A. *Explicit Contracts: Theory and Evidence*

An explicit labor contract codifies ex ante the relationship between economic conditions and certain characteristics of the employment relationship. Union-management collective bargaining agreements, resulting in explicit labor market contracts, currently cover about one-fifth of the labor force in the United States. One possible explanation for the popularity of explicit, as opposed to implicit, contracts is the lower costs of enforcing such arrangements.

A variety of factors influence the outcome of labor-management negotiations. In particular, the content of the contract may be heavily influenced by (i) wages offered by other employers, (ii) the firm's desire to attract its optimal amount and quality of labor, (iii) workers' desire to protect their earning power from erosion by inflation, and (iv) the political interests of the union's leader and the firm's executives. This list is certainly not complete and is merely meant to motivate our discussion of theoretical models of explicit union contracts and their subsequent economic consequences.

1. *Union Contracts.* If a general model governing the setting of union wage and employment levels can be identified, then the predicted behavior of union wages and employment over the business cycle can be compared to aggregate variations in these outcomes. Such an exercise may reveal the extent to which union contracts (and any nonunion contracts that mimic them) permeate the aggregate labor market.

For the purpose of discussion, suppose that unions are concerned with both the rate of compensation and the level of employment of their members. In seeking to maximize the welfare of the rank and file, the union will be willing to trade off employment against real wages. The preference of a union with respect to these two variables may be represented by the indifference curves labeled  $U(1)$  and  $U(2)$  in Figure 9, where  $U(2)$  corresponds to a higher level of utility than  $U(1)$ . Employers will also be interested in the levels of employment and workers' compensation. They will be indifferent between wage-employment combinations that leave profits unchanged. Such employer trade-offs may be represented by the isoprofit curves  $P(1)$  and  $P(2)$  in Figure 9, where profits at  $P(2)$  exceed those at  $P(1)$ . An isoprofit curve is positively sloped at those employment levels

Figure 9. Worker Preferences, Employer Preferences, and Wage-Employment Outcomes in a Unionized Labor Market

where labor's marginal revenue product exceeds its marginal cost and negatively sloped where marginal revenue product is less than labor's marginal cost. Marginal revenue product equals the marginal cost of labor at the peak of each isoprofit curve, therefore. Because the demand for labor is the locus of points for which marginal revenue product and marginal labor cost are equalized, the labor demand schedule (AIFG) is also the locus of the peaks of the isoprofit curves.

An efficient contract is defined as those wage-employment combinations where neither the union nor the employer could be made better off without making the other party worse off. For example, point B is inefficient because moving to point C increases the union's satisfaction, while leaving the employer's profits unchanged. Moving from point B to point D holds the union's level of satisfaction constant and increases employer profits. If, for example, negotiations begin at

point  $B$ , then mutual gains occur when the bargaining process leads to a point in the shaded lens-shaped area representing higher levels of both worker satisfaction and employer profits. Each point on the line segment known as the contract curve ( $DC$ ) consists of a tangency between an employer's isoprofit curve and a union's indifference curve. No further mutual gains from trade are possible once the parties reach an agreement along this locus of efficiency points (the contract curve).

According to John Dunlop (1944), it may prove insightful to view the behavior of a union as simply that of a monopoly seller of labor. Specifically, he suggests that we interpret the union as specifying a compensation level and then allowing the firm to select the level of employment that maximizes its profits. As a result, if the union in Figure 9 chooses real wage  $w(0)$ , say, the profit-maximizing firm will choose employment level  $N(0)$ . Note that this particular outcome is not on the contract curve, which means that if the union acts as Dunlop's monopoly seller of labor, then the resulting wage-employment outcome is likely to be inefficient.

On the other hand, suppose that union and management negotiators maximize joint welfare, regardless of the wage established during collective bargaining. This requires that  $(w, N)$  be chosen so that the rate at which the employer is willing to trade wages off against employment is identical to the rate at which the union is willing to trade them off (we are at a tangency of a  $P$  curve and a  $U$  curve in Figure 9). The two parties then operate on the contract curve, and the negotiated contract is efficient. In this case, if collective bargaining yields  $w(1)$  then employment would be  $N(1)$ , and the firm's profits would be less and its wage bill greater than the outcomes implied by the monopoly model at wage  $w(1)$ .

The above two stylizations of union-management behavior tend to generate different conclusions regarding the efficiency properties of union contracts. It is important to recognize, though, that other outcomes are surely possible because of the complex nature of contract negotiation. Deception is a common characteristic of the collective bargaining process because the parties have incentives not to reveal their true intentions. As a result, one party's perception of the other's payoff function is probably distorted, and there is no guarantee that the Pareto frontier will be reached. Thus, there seems to be no compelling reason either to presume *ex ante* that union-management contracts are efficient or to presume that they are inefficient.<sup>26</sup> More importantly, whether efficient and inefficient union contracts affect the variability of wages and employment over the business cycle differently is still an unanswered question, *a priori*. We also have little to say generally about the expected impact of explicit union contracts on the cyclical dynamics of wages and employment. Hence, it is not very clear (as yet) how theoretical microeconomic research on union-management bargaining behavior can help us understand the business cycle dynamics of the aggregate labor market.

**2. Overlapping Contracts: Wages and Employment.** John Taylor (1980) models the aggregate labor market as a collection of firms with nominal wage contracts having staggered starting dates. A firm reaches a new wage agreement only after it considers all other firms' wages, including those to be set in the future. In this case, each firm's contract wage is contingent upon other firms' wage settlements.

<sup>26</sup> Brown and Ashenfelter (1986) and MaCurdy and Pencavel (1986) seek to determine which of these two characteristics of explicit union contracts (efficiency or inefficiency) describe the U.S. newspaper industry.

A contract here specifies a fixed nominal wage for the duration of the agreement, and employment depends on fluctuations in the aggregate demand for product and labor. Although Taylor suggests that these labor contracts may be either implicit or explicit, it seems they are basically explicit because he assumes that an employer may secure, at no direct cost and without forecasting, accurate information on all wage agreements currently in force.<sup>27</sup>

In Taylor's theoretical model, the nominal wage outcome depends on a distributed lag of past wages incorporating earlier wage decisions and expectations of future wage outcomes. This process passes economic shocks from one contract to another, and the model predicts a persistence of unemployment due to random demand shocks. Specifically, if there is an unanticipated decline in product demand unemployment should rise for several quarters before tapering off. Unfortunately, this model has little to say about the movement of real wages over the business cycle. Still, Taylor's theoretical model is notable because it demonstrates that a macroeconomy with a non-Walrasian labor market—one characterized by overlapping fixed nominal wage contracts—is capable of yielding plausible predictions of the qualitative link between random fluctuations in aggregate production and (un)employment. How well does such a model fare when confronted with aggregate time-series data, though?

Taylor (1979) expresses the overlap-

ping contracts representation of the aggregate economy just described in empirical form. While the details are too complex to elaborate on in much detail here, the econometric model can be summarized as having five equations (real output, price level, money supply, unemployment rate, and nominal wage), each of which contains a series of lagged independent variables and lagged disturbance terms. Maximum likelihood structural parameter estimates from U.S. aggregate quarterly data for 1960:I to 1977:IV are all consistent with Taylor's qualitative a priori expectations. Among other things, past price shocks feed back into the wage formation process.

While Taylor's theoretical model (1980) and the results from its empirical counterpart, Taylor (1979), are provocative, Ashenfelter and David Card (1982) argue that Taylor's econometric analysis of his own theoretical model is incomplete. In particular, they point out that Taylor's explicit contract model also yields a number of testable hypotheses regarding the aggregate time-series patterns of money wages, employment, and unemployment. For example, Taylor's theoretical model implies that (i) the aggregate nominal wage is an autoregressive moving average (ARMA) and that (ii) unemployment has a similar stochastic structure.<sup>28</sup> We might also note that Taylor's theoretical model seems to yield a third testable hypothesis—that unemployment does not cause (statistically lead) the nominal wage in the aggregate data. Ashenfelter and Card believe that the hypotheses just mentioned, which Taylor (1979, 1980) did not investigate, must be tested to establish the validity

<sup>27</sup> It is important to point out that Taylor's model is difficult to relate to the nonunion sector of the labor market. Specifically, why should nonunion workers feel bound to a fixed contract duration when economic conditions change sufficiently? In the case of a business cycle expansion, say, employers will want to raise wages. Will workers prevent them from doing so because the contract has not yet reached its termination date? We think not. Thus, it is far from obvious that contracts are necessarily overlapping in the nonunion labor market.

<sup>28</sup> An estimating equation is autoregressive (AR) if lagged values of the dependent variable appear on the right-hand side. The moving average (MA) dimension refers to the possibility of persistent random shocks such that the regression also contains lagged disturbances.

of Taylor's overlapping contracts model of the aggregate U.S. economy.

Ashenfelter and Card first estimate a set of empirical associations in the aggregate quarterly data for the United States during 1956:I to 1980:I. They find that the stochastic structure of the nominal wage process differs noticeably from that of the unemployment rate.<sup>29</sup> Thus, Ashenfelter and Card reject both (i) the hypothesis that an autoregressive moving average empirical representation of nominal wages is appropriate and (ii) the hypothesis that unemployment and the nominal wage have the same empirical representation. In this way, they conclude that the time-series data for the aggregate U.S. labor market do not fit Taylor's overlapping contracts model.

To summarize, at any time the aggregate wage is an average of wages across industries, some of which are set by explicit contracts at various stages of their term. While unions may be the primary reason for such contracts, they currently cover only about 20 percent of the civilian labor force. Still, it is possible that their effect is more widespread through so-called spillover effects to the nonunion sector. The empirical research discussed in this section on overlapping contracts is an attempt to incorporate some intersectoral considerations into an analysis of how the aggregate nominal wage evolves and in turn influences aggregate (un)employment. Recent research on incentive contracts also attempts to incorporate some microeconomic details into our models of the aggregate labor market by taking account of the fact that employers, at the time they make wage-employment decisions, may also need to consider worker motivation.

<sup>29</sup> Ashenfelter and Card find that the data suggest only a low-order (one or two lags) AR representation for the nominal wage. On the other hand, the data indicate a low-order ARMA stochastic structure for unemployment.

Figure 10. Labor Demand When Marginal Productivity Depends on the Wage

**3. Incentive Contracts: Wages and Employment.** It is often argued that worker productivity depends on the real wage paid by the firm (Harvey Leibenstein 1957; Hajime Miyazaki 1984; Carl Shapiro and Joseph Stiglitz 1984; Janet Yellen 1984; Stiglitz 1986). This might come about because workers expend more effort or have better morale on the job at higher real wage levels.

The labor market implications of this situation can be seen in Figure 10, where the aggregate marginal revenue product of labor (MRPL) increases with the real wage. In this case, the profit-maximizing amount of labor equates the wage to the wage-dependent marginal revenue product of labor. The aggregate labor demand curve *D*, now connects points *a*, *b*, and *c* and will be less elastic than when labor demand is a single, unchanging MRPL schedule. Does the efficiency wage concept as captured in Figure 10 explain so-called involuntary unemployment? No.

Aggregate labor market equilibrium will still be determined by the scissors of supply and demand in Figure 10 with no involuntary unemployment at their intersection. While the concept of an efficiency wage redefines the labor demand relationship and suggests a reason why wages may differ across firms (effort dif-

ferences among workers), it does not by itself offer a reason for an excess supply of labor. That outcome still requires an argument for why the real wage will not fall to equate the supply and demand for labor. We know of no new or convincing explanations in the efficiency wage literature for this rigidity.<sup>30</sup> In short, we must look elsewhere for an explanation of the real wage rigidity and attendant cyclical unemployment that economists seek to understand with models of the aggregate labor market.<sup>31</sup>

### *B. Implicit Contracts: Theory and Evidence*

When a worker's skills are firm-specific and when the costs of acquiring these skills are borne in part by the worker and in part by the employer, the two parties have an incentive to form a long-term association to maximize the returns to this investment. Even if skills are not firm-specific, a long-term contract negotiated once avoids the costs of continually renegotiating a series of short-term contracts. Because these con-

tracts are not explicit formal agreements, but are more in the way of unwritten understandings, they are called implicit contracts.

The form of these long-term contracts will depend partly on the objectives of the worker and the employer. For instance, a simple long-term contract might take the form of paying the worker the value of his or her marginal product in each period. In this case, the worker's real wage fluctuates together with the employer's product demand curve. The basic notion behind the literature on implicit contracts is that the worker and the employer have different attitudes toward these movements in their incomes. In particular, a typical worker's income derives largely (if not entirely) from employment so that, subject to available savings, real wage fluctuations produce corresponding fluctuations in consumption and the standard of living. On the other hand, the employer is the bearer of risk in traditional economic analysis and through wealth diversification may be better able to protect consumption from fluctuations in income stemming from variations in the firm's product demand. In such circumstances, when the employer is better able and more willing to tolerate fluctuations in income than is the worker, there is an opportunity for the two parties to engage in an exchange that benefits both of them. Specifically, the employer could offer a contract that reduces the volatility of the employee's wage in return for a lower average wage. The employee is then paying something (in the form of a lower average wage) to avoid fluctuations in his or her standard of living, while the employer reduces wage costs below the level that would otherwise exist. Indeed, in a limiting case in which the employer cares only about expected profit and not at all about its variation (that is, the employer is risk neutral), the firm's wage

<sup>30</sup> For one such attempt see Akerlof (1980), who repackages the old argument that wages are largely determined by tradition and customs and are therefore invariant to changes in supply and demand unless such changes are very large.

<sup>31</sup> In related work at the microeconomic level, Edward Lazear (1984) theoretically analyzes the impact of various incentive programs designed to induce worker effort on the variability of an individual's earnings over the business cycle. For example, Lazear considers a firm where young workers are paid a wage less than the marginal value of their output, and when older receive a wage that exceeds the marginal value of their output (if still with the firm). The opportunity to capture an economic rent in the later stages of the working life provides an incentive for workers to shirk or quit less frequently. Under the compensation pattern just described, product price changes (a possible measure of cyclic activity) have a smaller effect on younger workers' earnings and a larger effect on older workers' earnings than in an auction setting where wages are always equal to the marginal value of output. Because of this, Lazear concludes there is no clear theoretical link between effort incentive arrangements and cyclic wage variability for workers on average.

costs could be minimized by offering employees a constant real wage (one that does not move with fluctuations in product demand conditions).

A firm with an implicit contract in effect may be thought of as having two departments—one that offers economic insurance to workers and another that produces goods and services to sell (Azariadis and Stiglitz 1983). The latter pays workers Walrasian auction market wages, which may fluctuate substantially with aggregate economic conditions. A worker then takes this wage to the insurance department who supplements it in economically unfavorable states (recessions) and charges a fee in economically favorable states (booms). Thus, the central feature of implicit labor market contracts is that "contract wages embody implicit payments of insurance premiums by workers in favorable states of nature and receipts of indemnities in unfavorable states" (Rosen 1985, p. 1145).<sup>32</sup> In this case, workers' nominal take-home pay should exhibit relatively less cyclic variation than if their money wages were established in a spot market for labor services. The possibility of a more cyclically damped real wage follows directly.

Remember that an efficient contract is one that exploits all possibilities to improve the parties' joint welfare. In other words, in terms of Figure 9, the firm and the worker determine wages and employment on the contract curve. But whereas in Section IV.A.1 the two parties settled on a single wage-employment

combination, the notion behind the literature on implicit contracts is that the firm and the worker have the option of specifying a wage schedule and an employment schedule with wages and employment dependent upon each realized state of demand. As we have seen, if the worker is averse to cyclical variations in wages while the employer is indifferent to such variations in his or her own income, the efficient contract will call for a constant real wage. In this case, the *option* of specifying a state-dependent real wage is not taken up.

Because implicit contract models tend to imply dampened wage variability relative to a spot auction market outcome, they therefore also imply relatively greater variability in the firm's total work hours; however, these models have little to say in general concerning the division between changes in hours of work per worker and layoffs when an unfavorable state of nature obtains.<sup>33</sup> In any event, recession-induced reductions in the labor input have been termed either voluntary or involuntary, and this distinction can help us evaluate the applicability of the implicit contract model. To elaborate, if an individual's utility, or more simply income, is unchanged, then a recession-induced hours reduction is termed voluntary underemployment and a recession-induced layoff is termed voluntary unemployment. The most obvious situation is where publicly available unemployment insurance (UI) along with privately provided insurance, termed severance pay, are sufficiently generous so that the underemployed or unemployed individual suffers no utility loss.

In reality, UI is incomplete in the United States in that (i) not all workers

<sup>32</sup> An important related point is that the appropriate specification of the aggregate labor market in a macroeconomic model depends on whether the labor market determines the properties of a long-term contract or whether it is the textbook spot market for labor. In the former case, the observed real wage is net of insurance payments (premiums) and both the aggregate supply and demand for labor must be re-specified to take this into consideration. This subtlety is typically ignored in models of the aggregate labor market.

<sup>33</sup> See Miyazaki and Hugh Neary (1983) and Murray Brown and Elmar Wolfstetter (1984) for additional theoretical analysis of the effects of a recession on employment versus hours of work within the context of an implicit labor contract.

are eligible to receive it, (ii) there is a maximum number of weeks (typically 26) that payments are made, and (iii) payments replace only a portion of lost earnings, including fringes such as health insurance.<sup>34</sup> Moreover, moral hazard and adverse selection problems substantially limit the availability of privately provided unemployment insurance. Specifically, given unemployment insurance, laid-off workers may reduce the intensity of their job search (moral hazard). Similarly, workers with a greater probability of being laid off are more likely to seek a job with severance pay (adverse selection). These two problems greatly reduce the economic incentives for employers to provide such insurance.<sup>35</sup> Not surprisingly, then, severance pay is largely nonexistent in the nonmanufacturing sector and in the most complete case (manufacturing workers in unionized firms) covers only about half the work force (Andrew Oswald 1986).

The previous paragraph suggests that recession-induced worksharing and lay-offs are likely to be involuntary in the United States economy in the sense described earlier and that implicit agreements reducing worker income volatility over the business cycle may be accompanied by cyclical variation both in their

standard of living and average wage payments. This means that the actual state of business conditions will be important to workers and firms alike; however, what if firms are better informed of the true state of the business cycle? In this case, there is an opportunity for employers to act deceptively by falsely announcing that a bad state (low product demand) prevails. Workers are aware of this possibility, of course, so that an implicit labor contract is implementable only if it contains a clause specifying penalties that make it uneconomic for the firm to behave deceptively.<sup>36</sup> Thus, if workers desire reduced income variability over the business cycle and firms agree to reveal the state of the economy truthfully, then implicit contracts can be struck and employer-employee attachment enhanced relative to a spot market for labor services.

We now examine the aggregate data in the United States for evidence of long-term implicit contracting between workers and firms.<sup>37</sup> As we will soon see, such evidence is unfortunately quite sparse.

#### 1. Evidence of Implicit Contracting?

An indirect, although inaccurate, way to infer the existence of implicit contracts is to examine data on worker mobility across employers. We say this because whether the labor market is characterized by a long-term implicit contract or a spot auction, workers should change employers on occasion to take advantage of superior opportunities for promotion and training, even though this means foregoing the benefits of long tenure with a given employer. A desire to enhance

<sup>34</sup> Some data from the *Economic Report of the President, 1986* are enlightening. During the heart of the 1982 recession, the average number of workers who were receiving UI payments was only about two-thirds the number of unemployed workers who reported that they were either job losers or job leavers. (Other types of unemployed workers, new entrants or re-entrants, are generally not eligible for UI payments.) In 1984, the most recently available year, there were 96.5 million U.S. workers in jobs covered by government UI programs of all sorts. This compares to a total civilian employment of 105 million. Finally, average weekly unemployment benefits during 1984 were about \$123 or 42 percent of the average pretax weekly wage (not including fringe benefits) of private nonagricultural production or nonsupervisory workers.

<sup>35</sup> For more discussion of the moral hazard and adverse selection problems in insurance see Jack Hirshleifer and John Riley (1970).

<sup>36</sup> A detailed discussion of this constraint and how it is incorporated into the theoretical equilibrium contract is beyond the scope of this paper. The curious reader should consult Sherwin Rosen (1985) for mathematical details. A handy graphical analysis is contained in Azariadis and Stiglitz (1983).

<sup>37</sup> Readers interested in more details of implicit contract models should consult the excellent surveys by Sherwin Rosen (1985) and Parsons (1986).

job security, and hence income, also motivates some workers to switch employers. If a long-term contract that reduces income variability is operational, though, the incentive to switch employers because of security considerations is substantially reduced. Thus, data on average job tenure allow weak inferences at best concerning the existence of long-term implicit contracting in the labor market. Data on employment duration, if correct, may be suggestive of firm-specific skills, not necessarily of implicit contracts.

Hall (1982) reminds us that median and average job tenure are misleading statistics because the labor force contains a substantial number of workers who are too young to have lifetime (long) job tenure, even if lifetime jobs were a general rule. Similarly, many older workers have once retired and then returned to work so their current jobs are of fairly short duration. Hall's data on job tenure, defined as service with an employer with no more than temporary layoff spells (30 days), suggest that the typical worker currently holds a job that has lasted eight years.<sup>38</sup> The OECD (1984) collates previously unpublished data from a household survey by the Bureau of Labor Statistics concerning tenure of all employed persons as of January 1983. Average job tenure in these data is 7.2 years, and approximately 27 percent of workers have more than 10 years of job tenure. Depending on race and sex, George Akerlof and Brian Main (1981) estimate average completed tenure of 10 to 18 years for jobs in progress during January 1968. According to the OECD report, average completed job tenure in the United States was approximately 15 years (for jobs held during 1978). Moreover, about 28 per-

cent of these workers were expected to have 20 or more years of tenure when they completed their jobs.

Micro data tell a similar story of long attachment for many workers. Parsons (1986) examines a ten-year panel from the National Longitudinal Survey of Mature Men. Among males who were 45–51 years old in 1966, 44 percent of the surviving whites and 39 percent of the surviving blacks were with the same firm 10 years later. In a similar vein, Masanori Hashimoto and John Raisian (1985) estimate the probabilities that U.S. males in a given age-tenure category during 1962 would be with the same firm in 1977. The job separation rates for workers initially possessing at least five years of tenure suggest lengthy employer-employee ties. The percentages of these workers expected to be with the same employer 15 years later were (i) 30 percent for workers 20–24 years old, (ii) 47 percent for workers 25–34, (iii) 54 percent for workers 35–44, and (iv) 40 percent for workers 45–49. Thus, the data described in this and the preceding paragraph comprise a body of circumstantial evidence suggesting long-term contracting.

Insofar as implicit contracts moderate cyclical variations in real wages, we might expect to find that long job tenure is paired with relatively little real wage variability while short job tenure is paired with relatively variable real wages across aggregate labor markets—additional circumstantial evidence concerning economy-wide long-term implicit contracting. There is, however, little correlation between various measures of cyclical real wage variability and job tenure across different OECD countries, for example (OECD 1984, p. 66). Thus, at the aggregate level, long job tenure is not obviously the result of implicit contracting. Because the aggregate U.S. economy is in many ways similar to other

<sup>38</sup> A word of caution is needed because Hall extrapolates from a few observations to generate a distribution of job offers.

OECD countries, our previous argument at lengthy job attachment in the United States may imply widespread long-term implicit contracting is further weakened. Clearly, more concrete evidence is needed, but we know of none in the existing literature.

### V. Concluding Remarks

One message comes through loud and clear in the aggregate labor market data of the United States. There is little empirical support for what has been termed the substitution hypothesis of cyclical movements in the aggregate real wage, employment, and unemployment. The surprisingly small body of appropriately focused empirical research has yet to find aggregate real wage misperceptions or intertemporal labor supply elasticities that are large enough for us to conclude that the aggregate labor market outcomes we seek to understand largely represent 'sighted workers' intended short-run labor supply responses in an auction setting.

A second interpretation of business cycle behavior is that the aggregate labor market fails to clear in the short run because wage and price rigidities cause firms to ration work opportunities. Tests of labor market rationing (persistent excess supply of labor) commonly hinge on whether cyclical unemployment is part of the desired labor supply. Empirical research generally finds that the aggregate real wage is downwardly rigid and supports the hypothesis that cyclical unemployment reflects a gap between actual employment and the point on the aggregate labor supply function associated with the current real wage. However, existing research on short-run labor market disequilibrium sidesteps the issue of so-called sticky wages and prices that exist with cyclical unemployment. The most logical argument seems to be that

it is part of a long-term contract between workers and firms.

Under an equilibrium long-term contract, the present values of the wage and labor's marginal product clear the labor market, and it is only by chance that current employment coincides with what workers would choose to supply in a spot auction market at the current real wage. Unfortunately it is difficult, perhaps impossible, to test the hypothesis that the aggregate labor market is characterized by long-term contracting because the predicted labor market outcomes are often indistinguishable from other theoretical models. Still, it is important to note that disaggregate evidence on job tenure indicates that many workers remain with the same employer for quite a long time. While this could be the result of repeated auctions that tend to match previous buyers and sellers, we think something more akin to long-term implicit contracting is occurring.

But perhaps no single model applies to all labor markets. For instance, some employees may be working in jobs involving a long-term association with their employers while other employees work under short contracts. This gives rise to the division between "job shoppers" and "careerists" (Michael Darby, John Haltiwanger, and Mark Plant 1985). In normal (full-employment) times, most of the unemployment comes from the former group, who exhibit high labor force entry and exit rates. Careerists rarely become unemployed, but when they do they spend a long time at it. Job search by careerists, then, dominates cyclical unemployment during the period when the economy is recovering from a recession, producing substantial persistence in cyclical unemployment. This is important because such unemployment rate persistence could be misinterpreted by a researcher as stemming from continual errors in wage expectations, when in fact

it simply reflects careful job search by (a heterogeneous group of) farsighted optimizing workers. In a similar spirit, Robert Topel (1986) develops a dynamic econometric model of spatially separated local labor markets that admits permanent and transitory economic shocks. Topel finds that transitory labor market shocks have the largest impact on what he terms the least economically mobile workers—the very new and very experienced. Those he terms the most economically mobile, workers in the middle of their working lives, seem to be buffered from such disruptions. Another interpretation of this result, though, is that we are witnessing a type of dualism at work—some workers with long-term contracts (“careerists”) and others with more short-term arrangements (“job shoppers”).

The two papers just discussed have in common an attempt to focus on worker heterogeneity, while largely remaining within an aggregate context.<sup>39</sup> Whether a hybrid approach emphasizing parallel labor markets of workers subject to short-term auction outcomes and those with long-term contracts can greatly improve our current empirical models of the aggregate labor market remains to be seen.<sup>40</sup>

# General Equilibrium with Free Entry: A Synthetic Approach to the Theory of Perfect Competition\*

By WILLIAM NOVSHEK

*Purdue University*

and

HUGO SONNENSCHN

*Princeton University*

*The essay is dedicated to the memory of Tjalling Koopmans (1910-1985). Our purpose has been to communicate to the nonspecialist an aspect of mathematical economics that has been developed since Koopman's masterful exposition of general equilibrium theory (1957). It is very difficult to do the job as well as Professor Koopmans, but he urged us all to try.*

## I. Introduction

THE TWO DISTINCT THEORIES of perfect competition, the Marshallian and the Arrow-Debreu-McKenzie (ADM), assume price-taking behavior as a fundamental. Filling blackboards with partial equilibrium diagrams, professors emphasize the Marshallian theory at the undergraduate level. As students progress, their teachers introduce them to the Arrow-Debreu-McKenzie theory, Gerard Debreu's *Theory of Value* (1959), the framework in which "highbrow theorists" explore the relation between perfect competition and economic efficiency. During the first half of this century, Mar-

shallian analysis unquestionably dominated the theory of value. Although this probably remains true, a growing number of papers in the applied areas adopt a variant of the ADM framework. Only in this context can they discuss the importance of interactions among markets and the distribution of wealth.

The Marshallian and ADM theories have many striking and essential differences, for example:

1. The ADM theory specifies a fixed finite number of firms. The Marshallian theory postulates a pool of firms, any number of which may be active in the market.
2. The ADM theory postulates that the technology of each firm is convex, which rules out increasing returns to scale. The Marshallian the-

\* We gratefully acknowledge the support of the National Science Foundation and our universities. We also thank Susan Elms for editorial assistance.

ory postulates that the average cost curve of each firm is U-shaped, based on the assumption of fixed costs of production or regions of increasing returns to scale.

3. The ADM theory assumes price-taking behavior regardless of the number of firms. The Marshallian theory assumes it only if the efficient scale is small relative to demand.
4. ADM theory, a general equilibrium theory, relates perfect competition and economic efficiency. Most of Marshallian analysis, partial equilibrium, ignores intermarket effects.
5. Finally, the ADM theory is a static one, to which the adjoinment of dynamics via a tâtonnement is not very satisfactory. The Marshallian analysis of equilibria is a dynamic one in the sense that entry and exit of firms cease in equilibria.

This essay explains a new theory of perfect competition, a synthesis of the ADM and Marshallian theories, and summarizes the recent work of many researchers (for example, Philippe Artzner, Carl Simon, and Hugo Sonnenschein 1986; Oliver Hart 1979; Andreu Mas-Colell 1974, 1983, 1986; William Novshek 1980; Novshek and Sonnenschein 1978, 1980, 1983, 1986a, 1986b; Kevin Roberts 1980; and Sonnenschein 1982). (See also the Symposium Issue, 1980 and the references therein.)

The new theory enables those economists who work in the world of U-shaped average cost curves and free entry to study intermarket effects and the decentralization and efficiency of perfect competition. We believe the traditional ADM theory dismays many Marshallians because it contains no role for marginal firms and insists on competitive behavior independent of the firm's ability to influ-

ence price. The synthetic theory allows both for marginal firms and for the firm to recognize its influence on price; it provides a precise general equilibrium framework for positive analysis and a framework in which to demonstrate the classical theorems of welfare economics. In contrast to both the ADM and Marshallian theories, we integrate into our analysis the leading classical explanation for price-taking behavior rather than assume it. We use the term *perfect competition* to describe a situation in which firms are arbitrarily small relative to their markets. Here firms perceive and take account of the price effect of their marketed quantities. As firms become small relative to the market, we observe in accordance with Cournot that their influence on price disappears and it is the limit of this that we call *perfect competition*. Because price-taking behavior is explained along the lines of the Cournot theory, what we offer might be better termed a *Cournot-Marshallian-ADM synthesis*.<sup>1</sup>

The Marshallian perspective enriches general equilibrium theory. A new condition effects a close correspondence between the general equilibrium model and standard intuition. Loosely speaking, it requires that prices provide the proper entry signals for firms and is a consequence of the dynamic aspect of Marshallian analysis. With each firm associated with the use of an unpriced and nondivisible resource, sometimes referred to as entrepreneurship, in equilibrium the returns to that factor must fall with entry and rise with exit. Such a condition might

<sup>1</sup> It is also important to acknowledge that small efficient scale and free entry, while sufficient to guarantee price-taking behavior in the limit, may not be necessary (see for example Michael Spence 1983). The extent to which free entry alone is sufficient (for the price-taking conclusion) is a much debated issue and is not discussed here. We believe that without the assumption of small efficient scale the case for price-taking behavior becomes less compelling.

seem axiomatic for partial equilibrium analysis where we cannot imagine its violation, but it is here that a general equilibrium perspective is important. In general equilibrium an increase in a commodity price, for example, a wage, has wealth effects via the changing value of the endowment that may increase the amount demanded of the commodity, for example, leisure, whereas in the typical partial equilibrium analysis of the firm such wealth effects are ignored. In general equilibrium the condition that prices provide the proper entry signals eliminates certain ADM equilibria. Hence, a combination of the Marshallian perspective and the general equilibrium perspective leads to better economics.

Before turning to the theory, a final word on the mathematical aspects of this paper. The papers on which we have based this essay are rather technical. Also, in its general form, the model we have in mind is more complicated than the model of equilibrium found in Debreu's classic *Theory of Value* (1959). In order to explain the results to the nonspecialist, we must forfeit either generality or precision. We will sacrifice generality and frame many of our arguments in a well-developed example. Although we loosely state our propositions, application to our example yields precision. Occasionally the included proofs hint at the arguments necessary for the general case. The interested reader can find proper statements and proofs in the references (in particular, Novshek and Sonnenschein 1986b).

## II. The ADM and Marshallian Models

To begin we present stylized versions of the ADM and Marshallian models in order to accentuate the relation between the ADM and Marshallian formulations. In particular, we will demonstrate that the ADM framework incorporates the

standard Marshallian specification. Next, we will use these models to motivate our definition of partial equilibrium markets (and general equilibrium economies) in which firms are small. This notion lies at the heart of our definition of perfect competition: Perfectly competitive markets (perfectly competitive economies) are markets (economies) in which firms are arbitrarily small relative to the market (economy).

### A. A Stylized Arrow-Debreu-McKenzie Model

Our development follows Tjalling Koopmans' (1957) classic exposition of a Robinson Crusoe economy. There are two commodities, leisure and food. Robinson uses his leisure as an input to produce food according to constant returns to scale technology. Employing a convention of the Arrow-Debreu-McKenzie theory, we denote labor input as a negative quantity and food output as a positive one. Summarizing the technology with an appropriate choice of units, Figure 1 indicates that one unit of labor input yields one unit of food output. Robinson has 24 hours of leisure, his entire initial endowment of resources, to offer as labor input. Adding his leisure endowment to the technology set, we obtain the set  $T$  of possible aggregate supplies. Each point in  $T$ , a bundle  $(l, f)$ , contains  $l$  units of leisure and  $f$  units of food and satisfies  $f \leq 24 - l$  (to be feasible,  $l$  units of leisure implies no more than  $24 - l$  units of labor, and food is produced 1:1 from labor).

Indifference curves, connecting equally preferred combinations of leisure and food, represent Robinson's preferences. In the economy of Figure 1, a unique "best attainable point" exists, which we have denoted by  $x$ .

A price system, a nonzero non-negative vector  $(p_l, p_f)$  of commodity prices, defines the dollar value of each bundle

Figure 1

$(l, f)$  as  $(p_l, p_f) \cdot (l, f) = p_l l + p_f f$ . Given the price system  $(1, 1)$ , the vector  $x = (l, f)$  maximizes the dollar value of supply at 24. Observe that  $(l, f)$  is not a unique maximizer of the dollar value of supply because each point of the north-east boundary of  $T$  has the same value. If the value of the supply action is distributed to Robinson, then at prices  $(1, 1)$  he will be able to afford bundles with  $l$  and  $f$  non-negative that satisfy the budget inequality  $p_l l + p_f f \leq 24$ . To maximize his utility Robinson demands  $(l, f)$ , and so at prices  $(1, 1)$  the profit-maximizing supply and the utility-maximizing demand coincide. This is the unique equilibrium for the ADM model. Interpreting the technology set as that available to a competitive firm, and the economy as a private ownership one in which Robinson owns both the firm and the single scarce input labor, we can describe the equilibrium as such: At prices  $(1, 1)$  taking these prices as given the firm maximizes profit by purchasing  $24 - l$  units

of labor and producing  $24 - l$  units of food. It pays  $24 - l$  for the labor and sells the food for  $24 - l$ , which earns zero profit. From his ownership of the firm, Robinson receives no dividends. However, as a holder of labor resource he receives offers from the firm  $(24 - l$  units) and from himself viewed as a consumer ( $l$  units) for all 24 units and thus earns an income of 24. As a consumer, Robinson uses his 24 units of income to purchase  $l$  units of leisure and  $f = 24 - l$  units of food. Both markets clear, and all accounts balance.

The interaction between markets above is explicit. For example, the wage determines the supply of labor and the demand for food through the relative price of leisure and food and the value of Robinson's initial endowment of labor. Developed with the classical theorems of welfare economics in mind, the ADM model of general equilibrium supplied precise conditions under which (a) equilibrium is efficient in the sense of Pareto

Figure 2.

optimum, and (b) every Pareto optimum is an equilibrium after a suitable redistribution of ownership.

We emphasize that the ADM model does not consider the plausibility of price-taking behavior. The model offers descriptions of perfect competition for situations in which bilateral monopoly (one consumer and one producer) or single agent maximization (Robinson) should apply.

### B. A Stylized Marshallian Model

We begin with a familiar textbook figure (Figure 2) where we have labeled average cost, marginal cost, and demand  $AC$ ,  $MC$ , and  $FF$  respectively. All firms are identical and their number is fixed arbitrarily at 3. The aggregate supply is zero up to price  $p^*$  ( $=$  minimum  $AC$ ); at  $p^*$  supply is the indicated four point set (with gaps of length  $y'$ , the efficient scale, between the points), and above  $p^*$  supply is the horizontal sum of the marginal cost curves.

If additional firms can obtain the technology represented by  $AC$ , then the aggregate supply shown is inconsistent with a situation in which profit-maximizing firms take prices as given. Note that at any price above  $p^*$  any firm in the market may earn a positive profit, and so all firms

Figure 3a.

should be active.<sup>2</sup> When each firm is maximizing profit ( $p = MC$ ) and the number of firms is such that firms have little incentive to enter or exit, we say that the market is in equilibrium.

Marshall applies his model of perfect competition when efficient scale (minimum average cost output) is small relative to demand. Another strong justification for the price-taking assumption is the fact that the horizontal gaps in the supply function at price  $p^*$  are small relative to demand. Here a particular number of active firms who maximize profit leave insufficient incentive for other firms to enter. The price in the market will exceed slightly  $p^*$ . Alternatively, we can consider an approximate equilibrium at price  $p^*$ , in which a finite number of firms maximize profit by offering the efficient scale output to the market, and demand very nearly matches supply. This is illustrated in Figure 3a.

In Figure 3b each firm achieves efficient scale at infinitesimal quantity  $M$ . We assume the existence of an unbounded mass of available firms. Let  $D$  be demand at prices  $p^*$ . Each firm producing at efficient scale  $M$  achieves an exact equilibrium at a mass  $D/M$  of active firms. Clearly Figure 3b represents a natural limit of markets of the type consid-

<sup>2</sup> Clearly, with free entry, an exact price-taking equilibrium will exist only in the unlikely event that the value of demand at price  $p^*$  is an integral multiple of the minimum average cost quantity.

Figure 3b.

ered in Figure 3a as efficient scale becomes small relative to demand. In the equilibrium of Figure 3b a continuum of firms produce.

### C. The Beginnings of the Synthesis

Let us first place the Marshallian model in the framework of the ADM theory to demonstrate that the framework of the ADM theory captures the Marshallian ideas. The U-shaped average cost corresponds to the firm technology represented in the second quadrant of Figure 4. The efficient scale is  $(-M, M)$ , corresponding to the minimum average cost point in partial equilibrium. We obtain the set of feasible aggregate production possibilities as follows. We start with an unbounded number of potential identical firms (analogous to free entry), each with the given production technology. Suppose  $n$  firms are active at each level of input. Select the allocation of inputs among firms that yields the maximum aggregate output. Next vary  $n$  to obtain the maximum aggregate output given the level of input. Repeat this for each input level, to obtain the aggregate technology. Combine this with the initial endowment to construct  $T$ , the feasible set of aggregate supplies. Given the indifference curves depicted in the first quadrant of Figure 4, no price-taking equilibrium will obtain. Observe that the only price

systems that lead to a positive output of food at a profit maximum take the form  $(p, p)$ . (Without loss of generality we will assume  $p = 1$ .) If the input price exceeds the output price, active firms operate at a loss; therefore all firms are inactive and production is  $(0, 0)$ , i.e., no input and no output. Alternatively if the output price exceeds the input price, each firm would make a positive profit by using  $M$  units of labor input to produce  $M$  units of food output. Hence all firms would be active, which requires an unbounded amount of labor. Thus for any price-taking equilibrium with positive food production, input and output prices must be equal. At prices  $(1, 1)$  a consumer demands  $z$ , and each profit-maximizing firm supplies either  $(0, 0)$  or  $(-M, M)$ . Hence aggregate supply (including the endowment) must take on one of the values  $\{(24, 0), (24 - M, M), (24 - 2M, 2M), \dots\}$ . In particular, the unique "best attainable point"  $x$  is not an equilibrium of the system.

By limiting the number of firms to three (as in the Marshallian example), we can find a price system  $(1, 1 + \epsilon)$  at which supply equals demand and excluded firms have little incentive to enter. Furthermore, the associated allocation approximates the "best point"  $x$  as illustrated in Figure 5. Because the output price exceeds the input price, all three

Figure 4

firms supply a positive amount. Point  $z'$  in Figure 5 represents the price-taking aggregate production plan. His income from ownership of the labor resource, combined with his (positive) dividend from ownership of all three firms gives Robinson a budget line through  $z'$ , which is his optimal choice. So aggregate supply equals aggregate demand.

Alternatively, at prices  $(1, 1)$ , we could consider an approximate price-taking equilibrium in which a finite number of firms produce positive quantities and maximize profit by offering the efficient scale output  $(-M, M)$ . In this situation demand nearly matches supply. Figure 4 essentially illustrates this where the gap between  $s_3$  and  $z$  is small. Once again demand almost equals the "best point"  $x$ .

In Figure 6 the efficient scale of each firm is an infinitesimal quantity and there

is an unbounded mass of available firms. As in the Marshallian Figure 3b, an appropriate mass of active firms achieves an exact equilibrium at prices  $(1, 1)$  at which each produces at efficient scale. Figure 6 represents a natural limit of markets of the type considered in Figure 4 as the firms become small relative to the market. We point out the similarity with the Arrow-Debreu-McKenzie economy of Figure 1 where the equilibrium and the "best point" coincide.

#### D. A Perfectly Competitive Economy

We will apply the term *perfectly competitive economy* to a regime in which firms are arbitrarily small relative to their markets. We adopt the classical position that consumers have no market power. However, we could have provided a similar treatment in which we

Figure 5.

view consumers and firms symmetrically. As in Marshallian theory, we assume that firms can freely enter and experience increasing returns to scale over some range of output to formalize the notion of the firm's being small relative to its market. In Figures 2 and 4 three firms, each producing at efficient scale, nearly satisfy the demand of consumers when price equals minimum average cost. By adding an identical twin for each original consumer to replicate demand, it would take six firms producing at efficient scale to satisfy demand approximately at the same price. Continuing in this manner each firm can be made arbitrarily small relative to its market. A perfectly competitive economy is a sequence of economies  $[E(\alpha_k)]$  in which firms become arbitrarily small relative to their markets. In our formulation,  $\alpha_k$  is a measure of firm size relative to the economy  $E(\alpha_k)$ , and we let the size of the firm in our economy diminish,  $\alpha_k \rightarrow 0$ . We denote the limit of the se-

quence by  $E(0)$  in which firms are infinitesimal. With this interpretation the market in Figure 3b represents the limit of markets in Figure 3a. Similarly, the economy in Figure 6 is the limit of a sequence of economies in Figures 4 and 5.

In each economy of the sequence we will assume that firms correctly perceive the (typically non-negligible) effect on prices of their output, and maximize profit accordingly. Although nonconvexities in the firms' production sets lead to generic nonexistence of price-taking equilibrium (i.e., nonexistence for all but "knife-edge" cases), Cournot equilibrium with entry frequently exists for the Marshallian model if efficient scale is small. This suggests that the limit of Cournot equilibria of  $[E(\alpha_k)]$  is a natural definition of an equilibrium for the perfectly competitive sequence  $[E(\alpha_k)]$ . In other words, we define perfectly competitive equilibrium as the limit of Cournot equi-

Figure 6.

libria with entry as firms become small relative to the market.

Not surprisingly we can characterize the perfectly competitive equilibria of the perfectly competitive sequence  $[E(\alpha_k)]$  in terms of its limit economy  $E(0)$  in which firms are infinitesimal. In light of this characterization we will show that firms in perfectly competitive equilibrium act "as if" they take prices as given in  $E(0)$ . On the other hand, we will show that other price-taking equilibria of  $E(0)$  exist that are not the limit of Cournot equilibria with entry and thus not perfectly competitive equilibria of the sequence  $[E(\alpha_k)]$ .

Before continuing our exposition a historical note is in order. In their treatment of general equilibrium theory, Kenneth Arrow and Gerard Debreu (1954) concern themselves with the representation

of the technology and behavior of the individual firm. Lionel McKenzie (1959), however, speaks of a competitive constant returns to scale aggregate technology. McKenzie assumes forthrightly that aggregate technology  $T$  is a convex cone, which follows from the additivity and divisibility of basic production processes.<sup>3</sup> We say a production set has the additivity property if for any two possible production plans the joint production plan is also feasible. It has the divisibility property if any production plan can be proportionately scaled down. Additivity is regarded as axiomatic when *all* factors that affect production are listed so that there can be no underlying fixed factor.

<sup>3</sup> The assumption that  $T$  is a convex cone with vertex at the origin means that for any two production plans  $x, y$  in  $T$ , and for all non-negative numbers  $a, b$ , the production plan  $ax + by$  is also in  $T$ .

Divisibility might be thought of as analogous to the assumption that commodities are infinitely divisible. McKenzie does not explicitly mention firms, but we might regard them as producing outputs from inputs according to one of an infinity of basic processes. When efficient scale is infinitesimal relative to the economy, these processes can be expanded or contracted continuously in the aggregate by varying the mass of firms using each process, and this corresponds to the situation in  $E(0)$ . Thus our foundations rest on the McKenzie interpretation of general equilibrium theory which we elaborate by explicitly modeling firms and by providing Cournot-like foundations for competitive behavior.

### III. The Partial Equilibrium Synthesis

An appropriate introduction to the notions of a perfectly competitive economy and perfectly competitive equilibrium is consideration of a partial equilibrium market. Besides being a natural stepping stone to our synthesis, it provides a rigorous foundation for the Marshallian theory. Explicitly, we establish the existence of equilibrium for the partial equilibrium market without either the need for introducing the approximate equilibrium notions described above or infinitesimal firms. Furthermore, firms correctly perceive their influence on price.

We first develop the notion of a *perfectly competitive sequence* of partial equilibrium markets. This is a sequence of Marshallian markets for a single homogeneous good where firms decrease in size. As suggested above, we define a *perfectly competitive equilibrium* as the limit of Cournot quantity setting equilibria-with-entry of the markets in the sequence.

Let us begin by returning to the Marshallian specification as in Figure 2. In

order to simplify the analysis we assume some special structure for the cost function  $C(y)$ , namely that total costs are zero if production is zero while, if production is positive, costs consist of both strictly positive fixed costs  $C_0$  and variable costs  $v$ . We assume variable costs increase with output at an increasing rate.

$$(C) \quad C(y) = 0, \text{ if } y = 0, \text{ and } C(y) = C_0 + v(y) \text{ if } y > 0, \text{ where } C_0 > 0, \text{ and for all } y \geq 0, v' > 0, v'' \geq 0. \text{ We also assume average cost is minimized uniquely at } y = 1.$$

An inverse demand function  $F$  specifies demand by associating a price  $[F(y)]$  with an amount  $(y)$  placed on the market. We assume

$$(F) \quad F \text{ is twice continuously differentiable and } F(y) = C(1) \text{ implies } F'(y) \neq 0.$$

These are regularity conditions that enable us to use the calculus in our analysis.  $(C, F)$  specifies the basic Marshallian market. We assume there is no bound on the number of firms with access to a particular cost function. This captures the idea of free entry. Of course in equilibrium, demand will limit the number of firms using a technology.

A perfectly competitive sequence of markets  $[M(\alpha_k)]$  is a sequence of markets in which firms become small relative to the market. Let  $C$  be the cost function for a firm in market  $M(1)$ . The corresponding average cost is  $AC_1(y) = C(y)/y$  for  $y > 0$ . We take a representative sequence of markets by rescaling the average cost functions: In market  $\alpha$ , the output  $\alpha y$  has the same average cost as output  $y$  in market 1. We can accomplish this by defining an  $\alpha$ -size firm corresponding to  $C$  as a firm with cost function  $C_\alpha(y) = \alpha C(y/\alpha)$ . An  $\alpha$ -size firm has average cost  $AC_\alpha(y) = AC_1(y/\alpha)$ , and attains minimum average cost uniquely at out-

put  $\alpha$ . For each  $\alpha > 0$ ,  $C$ , and  $F$ , we consider a market with a countable infinity of firms with technology  $C_\alpha$  facing market inverse demand  $F$ . We denote this market by  $M(\alpha)$ . As  $\alpha \rightarrow 0$ , firms become small relative to the market, and the aggregate production possibilities converge to the constant returns to scale case diagrammed in Figures 3b and 6. Given the cost function  $C$  and the inverse demand function  $F$ , we can define a perfectly competitive sequence of markets by any sequence of strictly positive real numbers less than or equal to one, where the sequence, representing firm size, shrinks to zero. We denote the limit market by  $M(0)$ . In particular, if the sequence of firm sizes is  $1, \frac{1}{2}, \frac{1}{3}, \dots$  then the perfectly competitive sequence of markets may be thought of as resulting from repeated replication of demand followed by the representation of output in per-capita (actually per-replication) units.

Cournot equilibrium requires that the quantity actions of firms maximize profit given the quantity actions of all other firms. In equilibrium no firm makes negative profit, because exit is possible and yields zero profit. Similarly, the assumption of an unbounded set of firms with access to the technology, only a finite number of which can be active (because of fixed costs), implies that in equilibrium no inactive firm can enter and make a positive profit. Stated precisely, a (pure strategy) Cournot equilibrium with entry for the market  $M(\alpha)$  is an integer  $n$  and a set of positive outputs  $(y_1, y_2, \dots, y_n)$  such that:

- (a)  $(y_1, y_2, \dots, y_n)$  is an  $n$ -firm Cournot equilibrium (without entry); that is, for all  $i = 1, 2, \dots, n$ ,  $F\left(\sum_{j=1}^n y_j + y_i\right)y_i - C_\alpha(y_i) \geq F\left(\sum_{j=1}^n y_j + y\right)y - C_\alpha(y)$  for all  $y \geq 0$ . No active firm can choose another production plan  $y$  and earn greater

profit given the production plans of all other active firms.

- (b) entry is not profitable; that is  $F\left(\sum_{j=1}^n y_j + y\right)y - C_\alpha(y) \leq 0$  for all  $y \geq 0$ .

Cournot equilibrium with entry is an "exact" equilibrium of the model where firms do not take prices as given. Individually maximizing profit, firms (noncompetitively) supply exactly the quantity demanded by consumers at the Cournot equilibrium price  $F(\sum y_j)$ .

Finally, we define the equilibrium output of the perfectly competitive sequence  $[M(\alpha_k)]$  as the limit of  $\sum y_j(\alpha_k)$  where  $[y_1(\alpha_k), \dots, y_{n_k}(\alpha_k)]$  is a Cournot equilibrium with entry of the market  $M(\alpha_k)$ . These are called *perfectly competitive equilibria*.

Our definition of perfectly competitive equilibrium formalizes the idea that perfect competition represents a limiting case of regimes in which firms can influence price. Among economists interested in rigorous foundations our definition may not at first be acceptable. They object because some or all of the markets that form a perfectly competitive sequence may lack a Cournot equilibrium. Hence our definition is meaningless. If demand is downward sloping, however, then a Cournot equilibrium exists eventually in any sequence of markets  $[M(\alpha_k)]$  forming a perfectly competitive sequence. By assuming that demand slopes downward our equilibrium concept will apply. Theorem 1 identifies the conditions "demand price equals minimum per unit cost" and "demand slopes downward" in the limit market  $M(0)$  as the characteristics of perfectly competitive equilibria for a sequence  $[M(\alpha_k)]$ . Free entry and exit determine the mass of active firms endogenously. Average cost curves are U-shaped (and so firm technology is not convex). The theory does not

assume price-taking behavior. Equilibrium is exact, production equals demand, and all firms maximize profit.

**Theorem 1.** (See Novshek 1980.) Given the cost function  $C$  satisfying (C), the inverse demand function  $F$  satisfying (F), and the perfectly competitive sequence  $[M(\alpha_k)]$ , the following conditions are equivalent:

- (1a)  $y^*$  is a perfectly competitive equilibrium for  $[M(\alpha_k)]$ , and
- (1b)  $F(y^*) = C(1)$  and  $F'(y^*) < 0$ .

For the case of partial equilibrium, the preceding result describes precisely our approach to perfect competition. Perfectly competitive equilibria are the limit points of Cournot equilibria of the Marshallian markets  $[M(\alpha_k)]$ .

This theorem establishes that these perfectly competitive equilibrium quantities in  $M(0)$  equate the inverse demand price of consumers and minimum average cost and satisfy downward-sloping demand. For the case of globally downward sloping demand, the perfectly competitive equilibria of the sequence  $[M(\alpha_k)]$  coincide with the unique Walrasian equilibrium in the derived constant returns to scale market  $M(0)$ . On the other hand, if inverse demand is not globally downward sloping,<sup>4</sup> then there may be Walrasian equilibria of the derived (constant returns to scale in the aggregate) market  $M(0)$  that are not by our definition competitive equilibria. These equilibria fail because we require that entry and exit also be at rest.

Figure 7 illustrates this point. In Figure 7, the points  $y^*$  and  $y^{**}$  are equilibria of the perfectly competitive sequence  $[M(\alpha_k)]$ , but  $\hat{y}$  is not, even though the demand price of consumers and minimum average cost coincide at  $\hat{y}$ . We ar-

Figure 7.

gue that  $\hat{y}$  does not constitute an equilibrium because an infinitesimal firm in  $M(0)$  can enter and make a positive profit. First, observe that in any Cournot equilibrium for the market  $M(\alpha)$  all firms make non-negative profit so aggregate output must lie in  $[0, y^*]$  or  $[\hat{y}, y^{**}]$ . Second, inactive firms must not profit by producing  $\alpha$ , so aggregate Cournot equilibrium output plus  $\alpha$  must lie in  $[y^*, \hat{y}]$  or  $[y^{**}, \infty]$ . This implies that aggregate output must lie in either the interval  $[y^* - \alpha, y^*]$  or  $[y^{**} - \alpha, y^{**}]$ . For small  $\alpha$  neither interval is near  $\hat{y}$ . In fact this is how one proves that 1a implies 1b. The hard part of the theorem is to show that for  $\alpha$  sufficiently small, if  $F(y^*) = C(1)$  and  $F'(y^*) < 0$ , then  $M(\alpha)$  has a Cournot equilibrium with entry with aggregate output in  $[y^* - \alpha, y^*]$ .

The above argument highlights the differences of our equilibrium concept and the Walrasian equilibrium in the limit market. In the Walrasian theory firms take prices as given, and in perfect competition we justify this as an approximation. The approximation applies so long as firms are small relative to their market and thereby have little influence in most any specification of strategic variables. Here the ability of each firm to affect price diminishes; however, in general each firm will have some influence that will affect the entry decision. If the entry of a firm will drive up price and make

<sup>4</sup> This becomes a more interesting possibility when demand is a function of both price and wealth (which in turn depends on price as in the derivation of the supply of labor).

entry profitable, then inactive firms will take account of this effect and enter. In our model small firms correctly perceive their influence; therefore equilibrium requires that no firm can drive up prices by entering.

## V. The General Equilibrium Model, Preliminaries

In this section we discuss the general equilibrium model on which we base our concept of perfectly competitive equilibrium. In the next section the model will be presented in the context of a simple example. This facilitates the exposition and should illustrate the close relationship between the partial equilibrium and general equilibrium models.

A perfectly competitive sequence of economies  $[E(\alpha)]$  is analogous to a perfectly competitive sequence of markets. As  $\alpha$  converges to 0 firms become arbitrarily small relative to the economy and the limit economy,  $E(0)$ , are infinitesimal. Each economy  $E(\alpha)$  has an unbounded set of potential firms. This provides our notion of free entry. In any equilibrium for  $E(\alpha)$  only a finite number of firms can be active, so inactive firms always exist and can test the profitability of entry. No firms enter if they cannot obtain positive profit by doing so.

In each economy  $E(\alpha)$ , we use Cournot-Nash equilibrium in quantities as our equilibrium concept. As in Marshall, we treat consumers as a competitive, price-taking sector to focus on the role of firms and entry. In the Cournot tradition, quantity setting provides a tractable basis for our analysis and, as was the case in the partial equilibrium model, it avoids the obvious problem of nonexistence of equilibrium that arises when firms set prices in conditions of production under increasing returns. When firms consider a quantity decision (a vector of input and output levels) they evaluate the corresponding

profit using an "inverse demand" function  $F$ . In the next section we will carefully construct this function. The idea is this: To each vector of quantity actions of all firms,  $y$ , the "inverse demand" function associates a price vector,  $p$ , such that the competitive consumer sector's excess demand, given prices,  $p$ , and the income generated by the consumers' dividend payments (their fraction of the profit or loss for each firm), exactly matches the aggregate quantity action of the firms. Thus the payoff for each firm is a well-defined function of its own production plan and the production plans of other firms. Although some firms may be making losses, for any vector of production plans employed by the firms, prices adjust so that all markets clear. A Cournot equilibrium exists if (1) each firm takes a feasible action in its production set; and (2) each firm maximizes profits given  $F$  and the actions of other firms. The assumption of nonconvex technologies (the general equilibrium analog of U-shaped average cost) implies that only a finite number of firms have nonzero actions in equilibrium. Note that inactive firms are available but cannot make positive profits by entry. Hence, the entry process is at rest in an equilibrium. Thus we have a description of Cournot equilibrium with free entry for each economy  $E(\alpha)$ .

For each economy  $E(\alpha)$ , consider the set of aggregate firm actions corresponding to Cournot equilibria of  $E(\alpha)$  relative to "inverse demand"  $F$ . We define the perfectly competitive equilibria of the sequence of economies  $[E(\alpha)]$  to be the limits of Cournot equilibria of the  $E(\alpha)$  economies. Explicitly, a price vector  $p^*$  and an aggregate production vector  $y^*$  form a perfectly competitive equilibrium of the sequence  $[E(\alpha)]$  provided that for an "inverse demand" selection  $F$  satisfying certain conditions,  $y^*$  is the limit of a sequence  $[y(\alpha)]$  as  $\alpha$  converges to zero.

where  $y(\alpha)$  is an aggregate production corresponding to a Cournot equilibrium of  $E(\alpha)$  (relative to  $F$ ). This coincides with the partial equilibrium model of Section III.

The partial equilibrium results in Section III depended on a condition of downward sloping demand. The results for general equilibrium will depend on an analogous condition, called DSD. Prices determined by the "inverse demand" selection  $F$  must give proper entry signals. At a point satisfying the ADM equilibrium conditions, additional entry must lead to new prices at which the entrants make losses. Because input and output prices change, the DSD requirement is that the net effect of all the price changes leads to a loss for the entrant.

Walras had something similar to DSD in mind (Leon Walras [1874-77] 1954, p. 225):

[U]nder free competition, if the selling price of a product exceeds the cost of the productive services for certain firms and a profit results, entrepreneurs will flow towards this branch of production or expand their output, so that the quantity of the product [on the market] will increase, its price will fall, and the difference between price and cost will be reduced; and, if [on the contrary], the cost of the productive services exceeds the selling price for certain firms, so that a loss results, entrepreneurs will leave this branch of production or curtail their output, so that the quantity of the product [on the market] will decrease, its price will rise and the difference between price and cost will again be reduced.

In the next section we will see how our framework allows us to analyze a logically precise general equilibrium model with nonconvex technologies where the number of active firms is determined endogenously and demand equals supply exactly. We do not assume price-taking behavior. Rather, when  $\alpha$  converges to zero the ability of a firm to affect price becomes arbitrarily small. At any per-

centage of firms, equilibrium production maximizes profit relative to the equilibrium prices. We will show that the equilibria of the perfectly competitive sequence satisfy all the conditions of an ADM equilibrium of the limit economy  $E(0)$ . Also, we will show that the classical welfare theorems still hold in our framework: every perfectly competitive equilibrium of the sequence is Pareto efficient and every Pareto efficient allocation for the sequence can be supported as a perfectly competitive equilibrium of the sequence.

### V. The General Equilibrium Synthesis

We adopted our general equilibrium model, with the exception of production sets (and our sequence of economies approach), from the standard Arrow-Debreu-McKenzie model. The economies  $E(\alpha)$  are composed of consumers and firms. Each consumer receives an initial endowment of goods and has preferences over potential bundles of goods. For example, the first two diagrams of Figure 8 show representative indifference curves for two consumers, A and B, in an economy with two commodities, leisure and food, each of which can be consumed only in non-negative amounts. Both consumers prefer to consume the two commodities in fixed proportions, person A at 1:1, person B at 1:2. A particular utility function that assigns utility equal to the minimum of  $l$  and  $f$  to a bundle with  $l$  units of leisure and  $f$  units of food represents person A's preferences. Similarly, one that assigns utility equal to the minimum of  $2l$  and  $f$  to the bundle  $(l, f)$  represents B's. They receive identical endowments of  $(1, 0)$ , containing one unit of leisure and no food.

To construct a general equilibrium analog of U-shaped average cost and free entry we differ from the standard assumptions on the producer sector in two important ways. Each firm's production

Figure 8.

set, the set of possible production plans for the firm,<sup>5</sup> has two components. The first is the origin (the production plan with no inputs and no outputs) and the second component is bounded away from the origin, compact and strictly convex. By *compact* we mean there is some number that is a bound for the magnitude of any input or output level in any feasible production plan (boundedness), and if a sequence of feasible plans has a limit, the limit is also feasible (closedness). By *strictly convex* we mean that for any two production plans in this component, any weighted average of the two plans is in the interior of this component. See Figure 9. This assumption provides a simple production set analog of U-shaped average cost in partial equilibrium. Inclusion of the origin in the production set guarantees free exit. For our example we will use the simplest version of this type of production, an on-off technology. The third diagram of Figure 8 shows the technology of a typical firm in  $E(1)$ . The firm has only two options. It can be inactive

with production plan  $(0, 0)$ , or it can use one unit of leisure as labor input (negative by convention) to produce one unit of food as output with production plan  $(-1, 1)$ . Observe that the production set  $\{(0, 0), (-1, 1)\}$  contains all possible input-output vectors for the firm. The firm cannot scale the production level up or down to produce  $(-2, 2)$  or  $(-1/2, 1/2)$ : there is an indivisibility in the production process at the firm level.

Our model differs from the standard ADM one in a second way. We assume that there is free entry with no bound on the number of possible firms. Each economy has an infinity of potential firms; a countable infinity of firms exist in each economy  $E(\alpha)$ , and a continuum of firms in the limit economy  $E(0)$ . In the Cournot equilibria of  $E(\alpha)$  only a finite number of firms operate so that there will always be additional firms to check the profitability of entry.

By rescaling technologies in a manner analogous to the rescaling of cost in the partial equilibrium model of Section III, we generate a sequence of economies  $[E(\alpha)]$  converging to a limit economy  $E(0)$ . For our example, each  $E(\alpha)$  contains

<sup>5</sup> Each production plan is a vector with a complete specification of all inputs and outputs for that plan.

Figure 9.

a countable infinity of firms with production sets  $\{(0, 0), (-\alpha, \alpha)\}$ . Note that a firm's technology is small relative to the economy when  $\alpha$  is small. The aggregate production set in  $E(\alpha)$  is  $\{(0, 0), (-\alpha, \alpha), (-2\alpha, 2\alpha), \dots\}$ : Aggregate production depends only on the number of active firms. The aggregate production set "converges" to the constant returns to scale technology that converts labor input into food output in the ratio 1:1. This constant returns to scale technology corresponds to the aggregate production set in the limit economy  $E(0)$  with a continuum of infinitesimal firms. (As a closed, convex set this limit aggregate production set satisfies standard ADM assumptions for the production set of a single firm.)

For simplicity the consumer sectors of each  $E(\alpha)$  and  $E(0)$  coincide, and consumer  $i$  owns a fraction of firm  $t$  independent of the firm (i.e., if  $\theta_{it}$  is the fraction of  $t$  owned by  $i$ , then  $\theta_{it} = \theta_i$  for all  $t$ ). In our example consumer A owns fraction  $\theta_A$  of each firm while consumer B owns  $1 - \theta_A$  of each firm. Let  $\theta_A = 3/4$ . Thus  $E(\alpha)$  "converges" to the limit economy  $E(0)$  in terms of both consumer and producer sectors.

In order to define a Cournot equilibrium in  $E(\alpha)$  we need a general equilibrium analog of a partial equilibrium inverse demand function so that firms can evaluate the profits corresponding to different actions. There is an important dif-

ference between partial and general equilibrium inverse demand functions. In partial equilibrium, dollar incomes remain constant while a single price varies. In contrast, the general equilibrium inverse demand function takes full account of the induced changes in income, through both changes in the value of endowments and in the received dividend payments.

The assumption of equality across firms of each consumer's ownership share implies that each consumer's wealth depends only on prices  $p$  and aggregate production  $y$ , and not on the arrangement of production among firms. If consumer  $i$  owns fraction  $\theta_i$  of each firm and has endowment vector  $w_i$ , then at prices  $p$  and the aggregate production  $y$  the consumer receives dividend payment  $\theta_i p \cdot y$  and has total income  $p \cdot w_i + \theta_i p \cdot y$ . (Because inputs are negative in  $y$ , the sum of individual prices times planned inputs or outputs is just the firm's profit at plan  $y$  given prices  $p$ .) If his corresponding vector of demand is  $D_i(p, p \cdot w_i + \theta_i p \cdot y)$  then the excess demand  $D$  of the consumer sector (the sum of individual consumer's gross demands, minus the sum of resources owned as initial endowments by the consumer sector) is the function  $D = \sum_i D_i(p, p \cdot w_i + \theta_i p \cdot y) - \sum_i w_i$ . An "inverse demand" selection  $F(y)$  is a function from aggregate production vectors  $y$  to price vectors  $F(y)$  that clear markets given the action of firms:  $\sum_i D_i[F(y), F(y) \cdot w_i + \theta_i F(y) \cdot y] - \sum_i w_i = y$ . This is the general equilibrium analog of partial equilibrium inverse demand. The corresponding partial equilibrium version as used in standard oligopoly theory would fix the income of consumer  $i$  at  $I_i$  rather than recognize that price changes affect income  $[F(y) \cdot w_i + \theta_i F(y) \cdot y]$ . Even after

price normalization several price vectors may clear markets given  $y$ . We assume  $F$  selects one of the price vectors.

We now illustrate an inverse demand function in terms of our example. Every feasible aggregate production plan assumes the form  $(-t, t)$  where  $t$  is non-negative. Normalizing prices to sum to one (because only relative prices matter) the price vector is of the form  $(1 - p, p)$  where  $p$  lies between zero and one. With aggregate production  $(-t, t)$  and price  $(1 - p, p)$  consumer A has income  $(1 - p, p) \cdot (1, 0) + (1/4)(1 - p, p) \cdot (-t, t) = 1 - p + (1/4)t(2p - 1)$  and consumer B has income  $(1 - p, p) \cdot (1, 0) + (1/4)(1 - p, p) \cdot (-t, t) = 1 - p + (1/4)t(2p - 1)$ . If  $p$  is strictly between zero and one then consumer A has demand vector  $(I_A, I_A)$  and consumer B has demand vector  $[I_B/(1 + p), 2I_B/(1 + p)]$  where  $I_i$  is the income of consumer  $i$  (recall Figure 8).

The "inverse demand"  $F(-t, t)$  for the example must yield prices that, together with the resulting incomes, generate aggregate excess demand  $(-t, t)$  in the consumer sector, to match exactly the aggregate production plan. Solving for  $F$  we find

$$F(-t, t) = \begin{cases} (0, 1) & 0 \leq t < 1/15 \\ [(15t - 16)/(6t - 4), (12 - 9t)/(6t - 4)] & 1/15 \leq t \leq 1/3 \\ (1, 0) & 1/3 < t \leq 2. \end{cases}$$

Observe that the inverse demand function depends on preferences and the initial distribution of wealth in the economy. In particular, when we consider a sequence of economies  $[E(\alpha)]$ , the inverse demand function is independent of  $\alpha$ .

Using "inverse demand"  $F$ , firms determine an equilibrium for  $E(\alpha)$  just as in the partial equilibrium case. In general

equilibrium the firms pick production plans to maximize profit, taking the production plans of all other firms as fixed. Free exit implies that in equilibrium no firm operates at a loss. Also, no inactive firm has an incentive to enter. Stated precisely, a Cournot equilibrium with entry for economy  $E(\alpha)$  (relative to "inverse demand"  $F$ ) is an integer  $n$ , the number of active firms, and a set of nonzero production plans  $(y_1, y_2, \dots, y_n)$  such that:

- $(y_1, y_2, \dots, y_n)$  is an  $n$ -firm Cournot equilibrium (without entry); that is, for all  $i = 1, 2, \dots, n$ ,  $y_i$  is a feasible production plan and  $F(\sum_{j \neq i} y_j + y_i) \cdot y_i \geq F(\sum_{j \neq i} y_j + y) \cdot y$  for all feasible  $y$ , and
- entry is not profitable; that is  $F(\sum_j y_j + y) \cdot y \leq 0$  for all feasible  $y$ .

Let  $F$  be a (continuous) "inverse demand" function for the economy  $E(1)$ . We define a *perfectly competitive equilibrium* for the sequence of economies  $[E(\alpha)]$  as a price vector  $p^*$  and an aggregate production plan  $y^*$  such that (1)  $F(y^*) = p^*$  and (2)  $y^*$  is the limit of aggregate production plans  $y(\alpha)$  corresponding to Cournot equilibria with entry for economies  $E(\alpha)$  (relative to  $F$ ). Observe that every specification of perfectly competitive equilibrium includes an underlying inverse demand function.

In our example, the use of the on-off technology greatly simplifies the analysis when looking for an equilibrium of the sequence: Each firm's profit depends only on whether it operates and the total number of active firms. In  $E(\alpha)$ ,  $N$  active firms result in each active firm receiving profit  $\alpha$  if  $N < 1/15\alpha$ ,  $\alpha(14 - 12N\alpha)/(3N\alpha - 2)$  if  $1/15\alpha \leq N \leq 1/3\alpha$ , and  $-\alpha$  if  $1/3\alpha < N$ . Inactive firms always have profit

zero. To be a Cournot equilibrium each active firm must have non-negative profit, so in equilibrium  $N \leq \frac{7}{6}\alpha$ . On the other hand, in Cournot equilibrium inactive firms must not have an incentive to be active, so in equilibrium  $N + 1 \geq \frac{7}{6}\alpha$ . Each  $E(\alpha)$  has a Cournot equilibrium with  $N(\alpha)$  active firms where  $N(\alpha)$  is the integer between  $(\frac{7}{6}\alpha) - 1$  and  $\frac{7}{6}\alpha$  (when  $\frac{7}{6}\alpha$  is an integer there are two values of  $N$  that work). The aggregate production plan in the Cournot equilibrium is  $N(\alpha)(-\alpha, \alpha)$  which differs from  $(-\frac{7}{6}\alpha, \frac{7}{6}\alpha)$  by no more than  $\alpha$  units of input and  $\alpha$  units of output. Thus in our example,  $p^* = (\frac{1}{2}, \frac{1}{2})$  and  $y^* = (-\frac{7}{6}, \frac{7}{6})$  is a perfectly competitive equilibrium for the sequence of economies  $[E(\alpha)]$ . At these prices consumer  $A$  chooses  $(\frac{1}{2}, \frac{1}{2})$ , consumer  $B$  chooses  $(\frac{1}{3}, \frac{2}{3})$ , and supply equals demand. Note that this agrees with the ADM equilibrium of the limit economy  $E(0)$ .

Next we would like to prove the first classical theorem of welfare economics: Perfectly competitive equilibria for the sequence  $[E(\alpha)]$  are efficient in the sense of Pareto. We begin by defining a Pareto efficient allocation for the perfectly competitive sequence  $[E(\alpha)]$ . First observe the way in which the sequence  $[E(\alpha)]$  converges to  $E(0)$ : The demand sectors of each  $E(\alpha)$  coincide with the demand sector in the limit economy  $E(0)$ , and the aggregate production sets in  $E(\alpha)$  converge to the constant returns to scale aggregate production set in the limit economy  $E(0)$ . As a consequence we define efficiency for the perfectly competitive sequence  $[E(\alpha)]$  partially in terms of the limit economy  $E(0)$ .

A vector listing the consumption of each consumer and an aggregate production plan is called an allocation; if it is feasible for  $E(0)$  then we say it is feasible for the sequence  $[E(\alpha)]$ . Feasibility requires that aggregate consumption differ from aggregate production by exactly the

aggregate endowment and also that aggregate production belong to the constant returns to scale aggregate production set of the limit economy  $E(0)$ . An allocation for the perfectly competitive sequence  $[E(\alpha)]$  Pareto dominates an alternative allocation if it makes at least one consumer better off while leaving the remaining consumers at least as well off. A feasible allocation for the sequence  $[E(\alpha)]$  is *Pareto efficient* if no feasible allocation Pareto dominates it.

*Proposition.* Equilibria of the perfectly competitive sequence  $[E(\alpha)]$  are Pareto efficient.

The standard argument for this result, applied to our example, proceeds as follows. Recall that the perfectly competitive equilibrium for the sequence  $[E(\alpha)]$  has corresponding allocation  $(\frac{1}{2}, \frac{1}{2})$  for  $A$ ,  $(\frac{1}{3}, \frac{2}{3})$  for  $B$ , and aggregate production plan  $(-\frac{7}{6}, \frac{7}{6})$  that yields zero profit at prices  $(\frac{1}{2}, \frac{1}{2})$ . This means that  $A$  supplies one-half of a unit of leisure (as labor input to the production process) and consumes one-half of a unit of food, while  $B$  supplies two-thirds of a unit of leisure and consumes two-thirds of a unit of food. In order to prove the proposition we must show that any allocation that Pareto dominates the equilibrium allocation is not feasible.

The set of bundles that  $A$  considers at least as good as  $(\frac{1}{2}, \frac{1}{2})$  is  $X_A = \{l, f) | l \geq \frac{1}{2}, f \geq \frac{1}{2}\}$ . Similarly,  $X_B = \{l, f) | l \geq \frac{1}{3}, f \geq \frac{2}{3}\}$ . To make one of  $A$  and  $B$  better off while keeping the other at least as well off would require in excess of  $\frac{5}{6}$  units of leisure and in excess of  $\frac{7}{6}$  units of food. But with only two units of leisure available in the economy, more than  $\frac{7}{6}$  units of food must be produced from less than  $\frac{7}{6}$  ( $= 2 - \frac{5}{6}$ ) units of labor. One can see immediately that such a production plan is not feasible with the one unit of food for each unit of labor constant returns to scale aggregate production set of the limit economy  $E(0)$ .

In general, we must use a less direct argument to show that a Pareto-dominating allocation  $a$  is not feasible. We combine the observation that, relative to the price system  $(\frac{1}{2}, \frac{1}{2})$ , the production plan that matches aggregate net consumption in  $a$  must yield a greater profit than does  $(-\frac{1}{6}, \frac{1}{6})$  with the fact that  $(-\frac{1}{6}, \frac{1}{6})$  is profit maximal in  $E(0)$ .

What are the properties of equilibria of the perfectly competitive sequence  $[E(\alpha)]$ ? How are these equilibria related to the ADM (price-taking) equilibria of the limit economy  $E(0)$ ? The answers agree with the partial equilibrium results of Theorem 1: The equilibria of the perfectly competitive sequence are those ADM equilibria of the limit economy that satisfy an additional condition, DSD. This condition is related to downward sloping demand in the partial equilibrium case.

Consider an equilibrium of the perfectly competitive sequence  $(p^*, y^*)$  relative to the "inverse demand" function,  $F$ . In  $E(\alpha)$ , a firm has a production set comprised of two components, the no-production component and the production one and the "inverse demand" function is continuous in a neighborhood of  $y^*$ . In our example the latter component of the production set contained the single production plan,  $(-\alpha, \alpha)$ . Though we did not assume price-taking behavior, as  $\alpha$  converges to zero a firm's ability to affect price becomes arbitrarily small. For  $\alpha > 0$  the entry or exit of firms has an effect on price. In the limit this effect disappears and the aggregate production plan  $y^*$  must maximize profit over the aggregate production set (a constant returns to scale cone) relative to prices  $p^*$ , and must satisfy  $p^* \cdot y^* = 0$ . (Because "inverse demand" is continuous near  $y^*$ , and the aggregate productions in the sequence of Cournot equilibria converge to  $y^*$ , if  $p^* \cdot y^* > 0$  then, for small  $\alpha$ , some feasible action for a firm in  $E(\alpha)$

would earn strictly positive profit at the Cournot equilibrium despite the price change due to entry by a single firm. Hence all firms should be active. Similarly, if  $p^* \cdot y^* < 0$  then some active firms in the Cournot equilibria of  $E(\alpha)$  make a loss, and should exit. If  $p^* \cdot y^* = 0$  but  $p^* \cdot y > 0$  for some  $y$  in the aggregate production set then again some firms could not have been maximizing in  $E(\alpha)$ .) By an interchangeability lemma<sup>6</sup> (see Koopmans 1957, p. 13) adjusted for the fact that in the limit there is a continuum of firms, any decomposition of  $y^*$  into feasible actions for the individual infinitesimal firms in  $E(0)$  is such that all firms' actions must be profit maximizing over their production sets relative to prices  $p^*$ . Thus the actions of firms are as if they are price takers in equilibrium, and an equilibrium of the perfectly competitive sequence is an ADM equilibrium of the limit economy  $E(0)$ .

A slight modification of our example demonstrates the differences between the requirement that in the limit firms are unable to influence price, and the assumption of price-taking behavior. The equilibria of the perfectly competitive sequence must satisfy an additional condition, (weak) DSD. The DSD condition is necessary to ensure equilibrium in the entry decision. As  $\alpha$  converges to zero, in the sequence of economies  $[E(\alpha)]$  firms become arbitrarily small relative to the market and thus have arbitrarily small impact on prices. Therefore, any production plan  $y$  in  $\alpha Y$  with  $p^* \cdot y < 0$  would not (for  $\alpha$  sufficiently small) be able to change price enough to make a non-negative profit. Because  $\max p^* \cdot y = p^* \cdot$

<sup>6</sup> The interchangeability lemma of Koopmans states that if one maximizes separately a linear functional on two sets  $A$  and  $B$  then its maximum value on  $A + B$  is simply the sum of the previous maximums. In less mathematical terms it states that centralized planning yields the same results as decentralized planning.

$y^* = 0$ , no actions  $\alpha y$  in  $\alpha Y$  with  $p^* \cdot y > 0$  are available. In our example, when an inactive firm becomes active it changes price by approximately  $\alpha[\partial F/\partial y(y)](-1, 1)'$  where  $[\partial F/\partial y(y)]$  is the  $2 \times 2$  matrix of partial derivatives. Because an active firm produces  $\alpha(-1, 1)$ , the entrant's profit minus the incumbent's profit before this additional entry is approximately  $\alpha^2(-1, 1)[\partial F/\partial y(y)](-1, 1)'$ . For the case of  $n$  commodities, the expression  $\alpha^2 y'[\partial F/\partial y(y^*)]y$  is (approximately) the profit differential (above the profit made by an active firm before this additional entry) available to an inactive firm by switching to  $\alpha y$  in  $\alpha Y$  with  $p^* \cdot y = 0$  in the  $E(\alpha)$  equilibrium. Weak DSD requires that this profit differential be nonpositive. When weak DSD fails, inactive firms could not be profit maximizing for  $\alpha$  sufficiently small. Thus firms would want to enter in  $E(\alpha)$ , and  $y^*$  could not be a limit point of any sequence of equilibria of  $E(\alpha)$  relative to  $F$ .

The DSD requirement, a static stability condition, is similar in spirit to Hicksian perfect stability (John Hicks 1939). Each considers changes in a single "market" at a time. Hicksian perfect stability requires that a fall in the price of a single commodity make demand exceed supply for that commodity (with or without other prices adjusting to clear other markets). The DSD condition applies to a change in the number of active firms of a particular type, with the corresponding change in aggregate production being a simultaneous change in several input and output commodities. Prices adjust to clear all markets given the new aggregate production. DSD requires that the profit for firms declines as more firms enter. Static equilibrium of the perfectly competitive sequence requires DSD.

We can demonstrate the consequences of failure of weak DSD in a slightly modified version of our example. Consider an example in which consumer  $A$  owns one-

fourth rather than three-fourths of each firm. For some aggregate production more than one price vector would clear the market, so the "inverse demand"  $F$  must be a selection from these prices. In particular let us examine the ADM equilibrium  $p^* = (1/2, 1/2)$ ,  $y^* = (-7/6, 7/6)$  which is unchanged because there are zero profits in that equilibrium. Taking the "inverse demand" with  $F[(-7/6, 7/6)] = (1/2, 1/2)$  and which is continuous near the ADM equilibrium  $y^*$ , we obtain  $F[(-t, t)] = [(16 - 13t)/(4 - 2t), (11t - 12)/(4 - 2t)]$  for  $12/11 \leq t \leq 16/13$ . Notice that  $p^* = (1/2, 1/2)$ ,  $y^* = (-7/6, 7/6)$  cannot be an equilibrium for the perfectly competitive sequence  $[E(\alpha)]$ : No Cournot equilibrium for any small  $\alpha$  has aggregate production corresponding to  $t$  near  $7/6$ . Such a Cournot equilibrium would require the number of active firms,  $N$ , to be between  $12/11\alpha$  and  $16/13\alpha$ . In that region each active firm earns  $\alpha(12N\alpha - 14)/(2 - N\alpha)$ , which is negative for  $N < 7/6\alpha$ . For  $N \geq 7/6\alpha$ , by engaging in production, an inactive firm changes from zero to strictly positive profit. Cournot equilibria cannot exist near  $p^* = (1/2, 1/2)$ ,  $y^* = (-7/6, 7/6)$  for any small  $\alpha$  because weak DSD fails. The ADM equilibrium for  $E(0)$  is not an equilibrium for the perfectly competitive sequence  $[E(\alpha)]$ .

Prices give the wrong entry signals in this example because of the general equilibrium income effects in  $E(\alpha)$ . The entry of an additional firm will result in a lower price for labor relative to food yielding profit for the entering firm. The necessary additional labor is obtained by lowering the wage. Because  $A$  owns only a small fraction of each firm, the reduction in the value of his leisure endowment (as labor) dominates his extra dividend (all active firms have strictly greater profit after the entry of an additional firm) and his income falls. Thus he reduces his demand for both leisure and food equally. On the other hand  $B$  owns a

large fraction of each firm, and his larger dividend dominates the reduction in value of his leisure endowment. Consumer *B* receives a larger income and demands both more leisure and more food, but in the ratio 1:2. The extra labor needed for production by the entrant and to compensate for reduced labor by *B* comes from *A*. *B* consumes the extra food produced and the extra food available because of the reduced demand by *A*. Though each consumer and firm is well behaved in a partial equilibrium sense, the general equilibrium income effects lead to an analog of upward sloping demand providing wrong entry signals.

The second welfare theorem is a more difficult theorem in our context. According to the ADM second welfare theorem, under suitable assumptions, every Pareto efficient allocation can be supported as an ADM equilibrium by redistributing wealth; however, not every ADM equilibrium of the limit economy  $E(0)$  is an equilibrium of the perfectly competitive sequence  $[E(\alpha)]$ . In our context we must redistribute initial endowments and ownership shares so that prices give correct entry signals (DSD holds). Otherwise, entry and exit might not cease near the Pareto efficient allocation, and therefore that allocation would not be a limit of Cournot equilibria of  $E(\alpha)$ , that is, an equilibrium of the perfectly competitive sequence  $[E(\alpha)]$ .

Despite the extra difficulties imposed by the requirement that prices give correct entry signals, it remains true that under rather general conditions (such as no externalities) a Pareto efficient allocation can be supported as an equilibrium of a perfectly competitive sequence. To do so, the redistribution of endowments and ownership shares must not only generate the required wealth level for each consumer but also ensure that prices give correct entry signals.

**Proposition.** For every Pareto efficient

allocation of the perfectly competitive sequence  $[E(\alpha)]$ , there exists a redistribution of ownership and initial endowments so that this allocation is a perfectly competitive equilibrium for the sequence  $[E'(\alpha)]$  obtained from  $[E(\alpha)]$  by the redistribution.

We can demonstrate this result in terms of our example. The first step is to find all Pareto efficient allocations. Set a utility level  $\bar{u}$  for consumer *A*. Maximize the utility of *B* subject to the constraints that the leisure-food allocation to *A* yields utility level at least  $\bar{u}$ , and the allocation to *A* and *B* is feasible given their aggregate initial endowment and the constant returns to scale technology of the aggregate production set of  $E(0)$ . Vary the utility level assigned to consumer *A* to trace out all Pareto efficient allocations.

By the nature of consumer *A*'s preferences (recall Figure 8), his utility depends on the minimum of the amounts of leisure and food he obtains. If his allocation has different amounts of leisure and food, then the excess amount of one above the other is wasted. Because that excess added to *B*'s bundle might increase the utility of consumer *B*, it should be clear that for this special example we can fix consumer *A*'s bundle, with equal amounts of leisure and food, rather than fixing his utility level. If *A* receives bundle  $(1 - d, 1 - d)$ , then a total of  $2 - 2d$  units of leisure are used (including the  $1 - d$  units to produce the food consumed by *A*) so  $2d$  units of leisure remain. The problem is to maximize *B*'s utility given those  $2d$  units of leisure and the technology that turns labor into food in a 1:1 ratio. Any bundle  $(2d - f, f)$  with  $f$  between zero and  $2d$  can be assigned to *B*, and the problem resembles a standard partial equilibrium consumer choice problem (see Figure 10) with solution  $(l, f) = (2d/3, 4d/3)$ . As  $d$  varies be-

Figure 10.

tween zero and one we trace out all Pareto efficient allocations, with  $d = 0$  corresponding to  $B$ 's receiving nothing, and  $d = 1$  corresponding to  $A$ 's receiving nothing. Observe that as  $d$  varies, the aggregate production  $(-1 - d/3, 1 + d/3)$  also varies.

With constant returns to scale technology, every ADM equilibrium will have zero profit and prices  $p^* = (1/2, 1/2)$ . Thus the Pareto efficient allocations can be supported as ADM equilibrium of  $E(0)$  only by assigning ownership of  $2 - 2d$  units of the aggregate leisure endowment to  $A$  and the remaining  $2d$  units to  $B$ . This generates the required wealth levels so that each consumer can purchase the appropriate bundle with prices  $(1/2, 1/2)$ . The ownership share of firms is irrelevant for the ADM equilibria.

To support these Pareto efficient allocations as equilibria of a perfectly competitive sequence  $[E'(\alpha)]$  we must also assign ownership of  $2 - 2d$  units of the aggregate leisure endowment to  $A$  and  $2d$  units to  $B$  in order to generate appropriate wealth levels. However, we must also assign the ownership share of the firms so that prices give the correct entry signals in  $E(\alpha)$ . The equilibrium corresponding to  $d$  must have aggregate pro-

duction  $(-1 - d/3, 1 + d/3)$  and prices  $p^* = (1/2, 1/2)$ . Solving for the "inverse demand" selection  $F$  which is continuous near  $(-1 - d/3, 1 + d/3)$  and satisfies  $F[(-1 - d/3, 1 + d/3)] = (1/2, 1/2)$  we obtain

$$F[(-t, t)] = [(3t + \theta t - 4)/(2d + 2\theta t - 2), (2d + \theta t - 3t + 2)/(2d + 2\theta t - 2)]$$

for  $t$  near  $1 + d/3$  where  $\theta$  is the fraction of each firm owned by consumer  $A$ . In  $E(\alpha)$ , when aggregate output is near  $(-1 - d/3, 1 + d/3)$  the entry of an additional firm changes the profit of each active firm by approximately  $(-\alpha, \alpha) \cdot \partial F / \partial t [(-1 - d/3, 1 + d/3)] \alpha = -9\alpha^2 / (\theta d + 3\theta + 3d - 3)$  ( $t$  changes by  $\alpha$  when a firm enters) which must be negative for DSD to hold. To give correct entry signals, we must redistribute ownership shares so that consumer  $A$  owns fraction  $\theta > 3(1 - d)/(d + 3)$  of each firm. This is possible for each Pareto efficient allocation corresponding to a  $d$  value greater than zero. That this can be done in general depends on a revealed preference argument.<sup>7</sup>

It is important to observe that our version of the second welfare theorem requires more flexibility of transfers than the corresponding ADM result (Debreu 1959, p. 95). In that theory all of the required redistribution can be achieved by means of a single commodity, which may be thought of as "government wealth transfer." Here more than a single commodity may need to be redistributed because the allocation of all of the endowments is important, not just the purchasing power. Leonid Hurwicz (1959) refers to the property that every

<sup>7</sup> At  $d = 0$  we hit the constraint  $\theta \leq 1$ . With  $d = 0$  and  $\theta = 1$  we have essentially a one-person economy; consumer  $A$  owns all the aggregate endowment and all of the firms. Because of the kink in the indifference curves in our special example,  $F$  cannot be made continuous near  $(-1, 1)$  for this case. Thus in this case there is a Pareto efficient allocation that cannot be achieved as a perfectly competitive equilibrium of a sequence  $[E'(\alpha)]$ ; however, this is an artifact of the fact that preferences are not differentiable.

optimum is an equilibrium (after redistribution) as "unbiasedness." Our analysis suggests a bias of the competitive mechanism beyond that which government transfers can correct. This bias can be corrected, but the correction in general requires more than the redistribution of a single commodity. From the viewpoint presented here, the competitive mechanism has the bias that it can seek out only those optima that, with the means of transfer at hand, give the necessary entry signals.

## VI. Dynamics

Marshall and Walras examined a long-run equilibrium in which all factors vary freely and "flow toward that branch of production" where they can realize profits. In the short run the returns to fixed factors do not necessarily equalize. At each moment, prices clear markets, but these prices reflect only the relative scarcity of the variable factors. Walras described the process from which these prices derive by a *tâtonnement*.

In each  $E(\alpha)$  firms correctly perceive the prices,  $F(y)$ , that will prevail given any aggregate production  $y$ . Thus our analysis presupposes an anticipated adjustment of prices to clear markets, a *tâtonnement* for the exchange economy generated by a fixed production vector  $y$ . In each Cournot equilibrium firms anticipate that the price vector  $F(y)$  will result from production  $y$ . At the equilibrium the prevailing price is the right price; that is, it equates supply and demand. Thus, no firm actually changes output in an equilibrium. We could have assumed that firms formed a subjective  $F(y)$ , but we required that  $F(y)$  actually clear markets. For our model of dynamics we assume that the adjustment of prices to clear markets is instantaneous relative to the speed at which firms are able to change production levels.

Following the standard Marshallian

framework, we next consider the quantity adjustments of a fixed number of active firms to achieve a short-run equilibrium. In  $E(\alpha)$  we assume a continuous Cournot dynamics. Assuming all other firms' outputs are fixed, each active firm changes its output continuously. In the limit economy  $E(0)$ , each firm is infinitesimal and this dynamics agrees with that generated by firms viewing price as fixed. In both  $E(0)$  and  $E(\alpha)$  the firms do not account for the adjustments of other firms or the changing of price over time. We prohibit exit in the short run, so that an active firm cannot produce zero. It must produce from the nonzero component of its production set (e.g., some inputs may be fixed in the short run so that even if all outputs are zero some inputs are used). If  $F$  is continuously differentiable and  $\alpha$  is small, then the firm has little effect on price. Thus the incentives and behavior of the firm in the short-run dynamic for  $E(\alpha)$  "converge to" that in the short-run dynamic for  $E(0)$ .

We build a bridge between the short run and the long run in the following manner. For concreteness, let us refer to the fixed factor as entrepreneurship. After each short-run adjustment we assume that entrepreneurship flows toward higher profits; that is, the number of active firms in each industry changes because of their profitability. Following such a period of factor movement, a new short-run equilibrium arises with associated prices, which lead to new incentives for factors to move, and so on. From this standpoint the *tâtonnement* occurs quickly relative to the short-run quantity adjustment of firms, which in turn takes place faster than the entry and exit adjustment of the entrepreneurial factor. As in the short-run adjustment, in  $E(\alpha)$ , recognizing only their own effect on price, firms enter or leave, so again, in  $E(0)$  this entry dynamic agrees with that generated by viewing price as fixed. In both the short and long run, firms behave

myopically. The entry-exit decision is a choice of production set  $\alpha Y$  or  $\{0\}$  (recall Figure 9). If  $F$  is continuously differentiable and  $\alpha$  is small, then the firm's decision has little effect on price. Thus the incentives and behavior of the firm in the long-run dynamic for  $E(\alpha)$  "converge to" that in the long-run dynamic for  $E(0)$ .

The DSD condition suggests a dynamic theory of convergence to the long-run equilibrium, in which the realignment of the entrepreneurial factor plays a significant role. Because DSD is a necessary condition for equilibrium of the perfectly competitive sequence  $[E(\alpha)]$ , no infinitesimal firm in  $E(0)$  can enter with positive profit at an equilibrium. However, we can conceive of a model where out of a long-run equilibrium the entry and exit of firms in a sector is proportional to the returns to the entrepreneurial factor available there. This leads us to consider the stability of the equilibrium introduced in the previous sections. It relates to the questions of whether returns to the homogeneous entrepreneurial factors tend to equalize and whether myopic profit-seeking behavior moves an economy toward a Pareto optimum. In addition, it is relevant to the viability of a planning procedure in which central planners increase production in the most profitable sectors.

Our previous argument that when  $\alpha$  is small, both the short- and long-run dynamics in  $E(\alpha)$  will be similar to the dynamics in  $E(0)$  assures us that we lose no generality by examining  $E(0)$  alone. Hence, for simplicity we will discuss the dynamics in terms of the limit economy  $E(0)$ . Our three stages of dynamics are as follows:

1. instantaneous adjustment of prices to clear markets given any aggregate production  $y$ ;
2. output adjustment by a fixed number (mass) of firms, each viewing price as fixed at each instant, to

reach a short-run equilibrium; and

3. entry and exit at a rate proportional to the (firm) profit levels in each industry to reach a long-run equilibrium.

The partial equilibrium market  $M(0)$  used in Section III adequately illustrates the dynamics that we have in mind. We add to the hypotheses from that section the condition that  $F$  is nonincreasing and there exists a unique  $y^*$  such that  $F(y^*) = C(1)$ . In this case there is a unique equilibrium.

Introduction of the dynamics is as follows. For each aggregate output  $y$ ,  $F(y)$  gives market-clearing prices, the adjustment process of which is stable because  $F$  is nonincreasing. In the short run an active firm must produce a positive quantity whether or not the positive profit-maximizing action yields positive profit. Each active firm increases output whenever the current price exceeds the marginal cost at the current output level and decreases output when current marginal cost exceeds price. This adjustment is also stable because  $F$  is nonincreasing and all firms have nondecreasing marginal cost. For each mass of active firms  $\mu$ , the short-run equilibrium price associated with  $\mu$ ,  $p(\mu)$ , is determined as follows:

1. Supply,  $S[p(\mu)]$ , is the integral of the profit-maximizing actions of the  $\mu$  active firms at price  $p(\mu)$ , and
2.  $F[S(p(\mu))] = p(\mu)$ ; that is, the inverse demand of supply at  $p(\mu)$  is  $p(\mu)$ , or short-run supply equals demand at  $p(\mu)$ .

Let  $\pi(\mu)$  denote the profit of each active firm when there are  $\mu$  active firms in short-run equilibrium. If DSD holds, then a mass of active firms  $\mu$  less than (greater than) the mass of active firms in the equilibrium of the perfectly competitive sequence receives positive (negative) profit. Thus in this case the long-

run equilibrium is globally stable under the long-run adjustment process:  $d\mu/dt = \pi(\mu)$ . Let us pause to interpret this. Suppose that we start with the initial mass of active firms  $\mu(0)$ . The prices,  $p[\mu(0)]$ , provide signals for entry. Over time the mass of active firms changes, inducing a continuum of short-run equilibria. The mass of active firms adjusts toward the final equilibrium at which firms earn zero profits and produce at efficient scale.

To examine these ideas in more detail we return to our original general equilibrium example. Recall consumer A's ownership share of firms is  $\theta$ . For  $\theta > \frac{3}{4}$  there is a unique equilibrium for  $[E(\alpha)]$ , the unique ADM equilibrium of  $E(0)$ , and DSD is satisfied. For any initial mass of active firms that leaves consumers in their consumption sets when each active firm produces at the efficient point  $(-1, 1)$ , the dynamics defined by  $d\mu/dt = \pi(\mu)$  converge to the unique equilibrium  $\mu^* = \frac{1}{6}$ . On the other hand, if  $\theta < \frac{3}{4}$ , then the unique ADM equilibrium remains  $\mu^* = \frac{1}{6}$ , but this allocation is not even locally stable. It is not locally stable for either the first-stage tâtonnement or for the third-stage entry dynamic using the "inverse demand" given in Section V. See Lars Svensson (1984).

The example at hand lends itself to a planning interpretation. Suppose that the central authority provides licenses for opening or closing facilities, but aside from this allows prices to be flexible. In the example we start with a certain mass of licensed facilities. If  $\theta > \frac{3}{4}$ , then the procedure that has facilities open when profits are positive and closed when there are losses converges to the unique Pareto optimal allocation.

Let us summarize the dynamics. Prior to this section we were concerned with static analysis. We treated time in the spirit of Debreu's *Theory of Value*, by dating all commodities and opening all markets only once for the purpose of de-

ciding on "who was to deliver what to whom and on what date." In this section the analysis is dynamic and temporary equilibrium in spirit. Markets open for today's exchange. The prices determined in those markets determine profits, which induce factor movements and a different distribution of firms tomorrow. The new distribution of immobile factors makes tomorrow's prices different from today's and so profits differ, etc. In our temporary equilibrium analysis we assume that firms are myopic; they do not consider how prices will change over time. Even with such nearsightedness, for our example, when prices provide the correct entry signals and so equilibrium exists, equilibrium is globally stable. This of course provides a strong link between the existence and stability theorem, and we consider this to be very much in the spirit of both Walrasian and Marshallian analysis.

## VII. Conclusion

As we have shown, with the right model it is not so difficult to travel between the world of the general equilibrium theorist and the Marshallian, partial equilibrium analyst. Furthermore, there are substantial gains from trade! A rigorous general equilibrium framework incorporates the Marshallian model, with marginal firms and U-shaped average costs. Perfect competition pertains to markets where firms are relatively small. In this case their ability to influence price disappears and price-taking behavior results from our theory. This is because in perfectly competitive environments the production sector mimics the behavior of a manager who is unable to influence price. Notice the enhancement of the classical welfare theorems: Competition leads to the number of active firms consistent with Pareto efficiency; it does not require the assumption of convex technology for the second welfare theo-

rem (this is in part because Cournot equilibrium does not require convexity); it highlights the effects of the distribution of wealth on the entry signals conveyed by prices and so on. Finally, the assumption that profits induce entry (and losses induce exit) plays a major role in the analysis and suggests a classical but much neglected dynamics that fits well with the Marshallian vision.

Our analysis suggests that we need not be content with a general equilibrium theory that excludes marginal firms and free entry and hypothesizes price-taking behavior for firms without regard to their strategic opportunities. At the same time we need not settle for a theory of value that does not account for intermarket effects and relies on indirect measures, such as consumer and producer surplus, for its welfare economics. We should be all the more suspicious of a theory that loosely specifies behavior and equilibrium. The theory exposited here does have its special features, but it is precise, and it allows us to encompass both the Marshallian framework and the classical welfare theorems. With this theory less compromise between descriptive relevance and mathematical precision is required, and as a result there should be better communication between the "highbrow" and the "bread and butter" theorists.

## Book Reviews

### 000 General Economics; Theory; History; Systems

#### 010 GENERAL ECONOMICS

*The economic mind: The social psychology of economic behavior.* By ADRIAN FURNHAM AND ALAN LEWIS. New York: St. Martin's Press, 1986. Pp. xii, 292. \$35.00. ISBN 0-312-23405-8. JEL 86-0635

Economists are imperialists by nature. We view the rational choice model as the uniquely correct way to explain and interpret human behavior, and we apply it without apology to questions once thought the exclusive province of other disciplines. Equally, we are disinclined to view facts and theories from other disciplines as relevant for economic behavior.

This posture has been costly. For while the rational choice model has proven useful in countless applications, there is extensive evidence that its predictions often fail. Many of its failures are systematic, not random, and psychologists have played a major role in calling our attention to them. In one experiment, Daniel Kahneman and Amos Tversky tell a group of people to imagine that, having earlier purchased theater tickets for \$10, they arrive at the theater only to discover they have lost them. Members of a second group are told to picture themselves arriving just before the performance to buy their tickets when they find that they have each lost \$10 from their wallets. People in both groups are then asked whether they will continue with their plans to attend the performance. In the rational choice model, the forces governing this decision are the same for both groups. Losing a \$10 ticket should have precisely the same effect as losing a \$10 bill. And yet, in repeated trials, most people in the first group say they would not attend the performance, while an overwhelming majority—88 percent—in the second group say they would.

Now Adrian Furnham and Alan Lewis have written *The Economic Mind*, in which they

summarize the findings of literally hundreds of studies in social psychology that bear on economic behavior. Many of the experiments they report are interesting quite apart from their possible implications for economic choices. One particular collection of studies, for example, asks people to estimate the physical size of coins of various denominations. The consistent finding is that the estimates are strongly negatively correlated with income: The poor, for whom concerns about money understandably loom large, think coins are much bigger than the rich do.

Under the heading of "Social Issues and Problems," Furnham and Lewis review studies that relate to poverty, wealth, unemployment, and the Protestant work ethic. The best of this material relates to the decline of the latter and its replacement by the so-called "wealth ethic," in which activities are valued only insofar as they augment personal wealth. Other authors have argued that moral norms, such as those prominent in the Protestant work ethic are important for solving principal-agent problems. It may be no accident, then, that economists' interest in these problems has grown with the emergence of the wealth ethic.

Furnham and Lewis review numerous studies on consumption and saving that will be useful to economists for suggesting additional control variables—especially attitudinal ones—for empirical work. The literature they cite makes a convincing case that attitudes account for a great deal of the observed variation in individual savings rates.

They also discuss gambling, a topic that has troubled proponents of the rational choice model for many decades. They cite Gilovich's provocative finding that people are much more likely to gamble when the process affords at least the illusion of personal control. Picking a number on a roulette wheel, for example, is apparently much more attractive than trying to draw a preassigned ball from an urn, even

when the expected payoffs are identical. This finding is obviously unfriendly to the rational choice model, and may help explain the Clotfelter and Cook finding (1986) that state lotteries did not succeed until they gave people a chance to pick their own numbers.

The last substantive chapter in the book, in many ways the most interesting, deals with taxation. It draws heavily on Lewis' earlier work on the subject. Among other things, it tells us what factors shape attitudes about the fairness of taxes, which people are most likely to cheat, and how people perceive the odds of getting caught.

Perhaps because the book tries to cover so much territory, there are some significant flaws, even an occasional factual error. On page 109, for example, the authors assert that reported happiness levels are not related to income in cross-section, even though numerous studies document a strong positive correlation (Easterlin 1973). And on page 176, they state that income levels are not significantly related to cross-sectional savings rates. Although some economists may still believe this, study after study has shown that savings rates rise sharply with income in cross-section (Mayer 1972). This relationship holds both for measured income and, less strongly but still significantly, for permanent income.

I am reluctant to criticize the authors on such a personal matter as writing style. But in a book that sells for \$35, it seems fair to expect the St. Martin's copy editor to have labored a little longer on paragraphs like this one from chapter three, in which Hurlock, "time concepts," and "number concepts" are mentioned for the first and last time:

Hurlock (1972) maintains that money concepts, unlike time and number concepts, tend to lag behind those of many other concepts. Many of the things Hurlock says have not been substantiated by recent research, possibly due to her selection of articles. However more recently there has been a great deal of research in this area. One theme of the earlier work which is still apparant [sic] in current research are [sic] studies on the developmental stages that children pass through in the acquisition of various economic concepts (p. 25)

There are many such paragraphs in *The Economic Mind*, and they make for slow going.

From an economist's perspective, the book's

topic coverage may seem puzzling. In describing their choice of material, Furnham and Lewis mention a distinction between "psychological economics" and "economic psychology." The former refers "to work, mainly by economists, that employs psychology to improve and expand the discipline of economics," while the latter "deals more with the extension of the examination and investigation of social behavior into the economic realm" (p. 18). The authors declare economic psychology to be the main focus of their book, which presumably explains why they give only fleeting attention to the work of "psychological economists" like Duesenberry, Leibenstein, Scitovsky, and Simon, and make no mention at all of Akerlof, Hirsch, Hirschman, Pollack, or Thaler.

But the utility of this distinction is never really made clear. Surely anyone—psychologist or economist—who has any interest in the intersection of these disciplines must want to know how psychological concepts help explain economic behavior. Why should economic psychologists be any less interested than psychological economists in what someone like George Akerlof has to say?

Economists and psychologists alike may also wonder why the authors devote such scant attention to the work of Kahneman and Tversky. Their "behavioral decision theory" pervades recent research by social psychologists in this country and has even begun to make its way into mainstream economics. And yet, in *The Economic Mind*, this work merits little more than a single page.

Like most authors, Furnham and Lewis complain that space limitations prevented them from covering much valuable material. At least some of what they did include, however, would have been better left out. More careful wielding of the editorial scalpel would have made room to discuss, say, the vast prisoner's dilemma literature, or some of the countless other studies in social psychology that bear directly on whether people pursue self-interest. For both economic psychologists and psychological economists, this would have made for a stronger book. Even so, much of the research discussed in *The Economic Mind* will prove useful for economists who are willing to question the descriptive accuracy of the rational choice model.

## 020 GENERAL ECONOMIC THEORY

*Superfairness: Applications and theory*. By WILLIAM J. BAUMOL with contributions by DIETRICH FISCHER. Cambridge, MA and London, England: MIT Press, 1986. Pp. xi, 266. \$20.00. ISBN 0-262-02234-6. JEL 86-0977

The general concept of fairness is old but since the end of 1960 its connotation of an envy-free allocation has been the object of extensive analysis in economic theory. A merit of the concept is that it generalizes the simple rule of equal division to complex situations without making use of interpersonal utility comparisons. In the present book William Baumol applies the concept to a number of relevant policy questions, e.g., industry pricing in a multiproduct firm, public pricing, compensation for externalities and the function of an arbitrator.

The volume contains twelve chapters, some of which to a great extent stand by themselves and were previously published in various economic journals between 1969 and 1982. The general structure of the book consists of three introductory chapters, where the basic theoretical issues are presented, followed by a number of concrete examples of application.

The reader is first given an overview of the theory of fairness. The presentation is mostly elementary and often restricted to two individuals and two commodities taking advantage of the Edgeworth box. The diagrammatic analysis is sometimes heavy going but requires no complex mathematics. For the normative analysis, basic concepts such as superfairness, super-equal and Pareto optimality are introduced. Those are global concepts, but for the applications corresponding partial or local concepts are more pertinent and lead to the concepts of incremental superfairness, incremental super-

equality and Pareto improvements. There is of course a danger in the use of local concepts for analysis and later in the book one can find examples where, e.g., an incremental superfair policy may change a superfair situation to an unfair one. Even though the partial analysis is directed towards applications, it has at least in one respect a value of its own. The fairness criterion (i.e., envy-free) does not generally single out a unique state as the fair one but a final choice requires some additional distributional criterion. Here Baumol uses partial analysis to narrow the set of fair distributions by taking incremental superfair steps.

The theoretical background material concludes with some very interesting historical notes, where the reader can follow the various relationships among the early contributors to fairness theory.

The book then continues with applications. As a first point, allocation of commodities by rationing is taken up. This is a natural choice since departures from the market (or rather price) mechanism are often motivated by equity arguments. Four different rationing procedures are considered and Baumol demonstrates that equity is not necessarily the outcome. In particular, systems with salable rationing points need not be fair. An explanation is that salable points may cause a "loss of the feeling of fairness." One could also note that salable and unsalable rationing points are different "goods," which may be demanded differently by the wealthy and the nonwealthy. The chapter about rationing seems most relevant to fairness analysis and to the analysis of the trade-off between equity and efficiency.

This trade-off is also central in a chapter analyzing how victims of externalities should be compensated. The main conclusions are that any compensation is inconsistent with Pareto efficiency and that there are cases where fairness requires not only compensation but also overcompensation of the victims. The analogy with moral hazard is stressed.

Industry pricing is the subject of analysis in two chapters. More precisely, a multiproduct firm has options to set prices on its products in different ways when competition is not perfect. Cross subsidy then becomes a possibility and the question is which price configurations are unfair. Baumol examines various methods of price setting, based on incremental cost,

stand alone cost, anonymous equity and game theoretical concepts such as the core, the Shapley value and the nucleolus. Prices may be bounded within certain limits by using various cost sharing principles in combination with the Pareto principle, while the fairness criterion does not always seem to be pertinent.

Two chapters deal with public pricing. One problem is fairness of peak pricing. The analysis is primarily undertaken in terms of the Pareto principle and the pure fairness analysis is not central. The second problem deals with taxation for equality. Not even in this case is the fairness criterion pertinent; the analysis is based on ordinary social welfare functions. Since complete equality is never achieved by distortionary taxation, Baumol suggests taxation of ability instead. Such discriminatory pricing is not a practical solution but might be used in some modified form, e.g., by discrimination among broad income groups. Yet, in view of the vast taxation literature, this section about taxation does not appear very fresh to me. The fairness criterion could probably be used to evaluate different forms of taxation—taxation of labor incomes, taxation of various types of capital incomes, capital gains taxation, etc.—in a similar manner as is done in the case of industry pricing.

A more informal discussion of fairness in relation to economic illusions, divorce settlements, taxation, etc. is provided at the end of the book. A concluding chapter deals with a very interesting situation for fairness analysis. As is well known, criteria of distribution tend to exclude unfair distributions rather than select a unique fair one. A final choice may then require an arbitrator. Various arbitration procedures in pursuit of a unique fair solution are discussed. As an example of fairness application, this part of the book is most interesting.

In sum, I find this book useful as an elementary introduction to the theory of fairness, although its main contribution is the application to concrete policy situations. Parts of this material are traditional welfare analysis but issues of equity are put forward throughout the entire book, in verbal terms where formal analysis is absent. The book covers a wide range of applications and will surely inspire future research.

LARS-GUNNAR SVENSSON

*University of Lund*

*Consumption behavior and the effects of government fiscal policies.* By RANDALL P. MARIGER. Harvard Economic Studies series, vol. 158. Cambridge, MA and London: Harvard University Press, 1986. Pp. xi, 265. \$32.00 ISBN 0-674-16635-3.

JEL 87-0026

Responding to the intractable problem of solving for optimal consumption under uncertainty, many recent empirical tests of the life cycle hypothesis have focused exclusively on the validity of the consumer's first order equation for consumption (i.e., Hansen and Singleton 1982; Mankiw, Rotemberg, and Summers 1985). Nearly all these tests of continuous dynamic optimization have failed, leading some researchers to question the usefulness of the underlying life cycle framework. By contrast, Randall Mariger's book provides substantial new evidence "that the standard life cycle consumption model, modified to allow for liquidity constraints, explains the consumption behavior of the vast majority of families" (p. 155). This book's central contribution is the formulation and testing of a detailed, closed form consumption function, uniquely designed to study liquidity constraints. The price Mariger pays for a structural model is that he must assume certainty equivalence.

After a brief introduction, the book begins with a theoretical review of the life cycle model of consumption with zero bequests. Mariger describes a simple procedure for solving for optimal consumption if an exogenously given, time varying minimum level of wealth must be held in each period. He shows how such collateral restrictions lead to "pockets" of liquidity constraints throughout one's life; that is, to one or more multiperiod intervals in which the consumer faces a binding constraint only in the last period of each interval. Mariger argues that borrowing restrictions may commonly lead to short multiperiod horizons (as opposed to single period horizons), for example during years when a family has growing children and unusually high consumption needs, or when the family is accumulating a downpayment to purchase a consumer durable. The review concludes with a brief discussion of intergenerational altruism.

The next chapter summarizes theoretical re-

sults regarding the implications of liquidity constraints and intergenerational transfers for government fiscal policy and critiques recent empirical studies of liquidity constraints and planned bequests. Mariger argues that recent research has yielded little direct information about the nature of or quantitative importance of liquidity constraints. Previous studies, for example, are unable to identify liquidity constraints involving multiperiod horizons. Similarly, Mariger claims, little is known about bequests.

In Chapter 4, Mariger formulates his econometric life cycle model of consumption with liquidity constraints and zero bequests. Agents are assumed to maximize an isoelastic utility function modified to allow for changing family size. Future family composition is uncertain, but agents are assumed to behave as if expected family composition will be realized with certainty. Future income is nonstochastic. The real rate of return is assumed constant. The novel aspect of Mariger's model concerns the very careful and detailed specification of expected family size and characterization of minimum net worth levels that a particular family is required to hold in each period.

The subsequent two chapters describe the data, variable construction and econometric methods. Mariger utilizes an 800 observation cross section subsample of households from Dorothy Projector and Gertrude Weiss' *Survey of Financial Characteristics of Consumers, 1962-63* (Washington, DC: U.S. GPO, 1966) and estimates his model using nonlinear least squares.

The results, presented in Chapter 7, suggest that the data fit the model quite well. The findings on liquidity constraints indicate that about 10 percent of the U.S. population has a one-year horizon while another ten percent has an horizon that extends to a time when a child leaves the home. Mariger also finds evidence that household tastes may be quite heterogeneous. Another interesting prediction of Mariger's model is that households do not choose to decumulate equity in their homes/autos as they age. Mariger argues in Chapter 8 that this asset accumulation is precautionary, not altruistic. The author concludes by presenting a wide variety of specification tests which indicate that the model is fairly robust.

The remaining three chapters present the results of various simulations based on the econometric model. Simulation indicates that having two or more children is a major cause of liquidity constraints. Simulation of the partial equilibrium impact on aggregate consumption of various tax changes reinforces the conclusion that, in a perfect foresight, life cycle economy, temporary tax changes have significant lagged effects. The last set of simulations focuses on the general equilibrium reduction in steady state savings induced by a pay-as-you-go social security system, with emphasis on the effect of liquidity constraints.

Although Mariger examines the theoretical foundations of his model with great care, the most useful and original aspects of the book are empirical. In its detail, the book reveals the painstaking care taken in developing a testable consumption function, in constructing complex variables, and in checking and rechecking the model's robustness. The resulting model is quite rich in its ability to explain life cycle behavior.

The model's main difficulty concerns its tremendous informational requirements. As a result, the model cannot effectively study the behavior of consumption under uncertainty. As Mariger points out, the certainty equivalence assumption causes the level of consumption to be overestimated. Recent work by Zeldes (1985) establishes that, at least in the case of isoelastic utility, labor income uncertainty also increases the volatility of consumption to wealth changes. In some cases the deviation of actual consumption from that predicted by certainty equivalence may be dramatic. Thus, certainty equivalence also biases downward the marginal propensity to consume. In a study that focuses on marginal consumption responses to government fiscal policy, this necessary simplifying assumption constitutes a limitation of the model's predictive ability. On the other hand, direct "Euler equation" tests of consumer optimization, while not requiring a closed form for consumption, have so far shed relatively little light on the economic factors influencing consumption behavior. Mariger's approach represents a successful alternative and a refreshing change.

*Ethics and economics*. Edited by ELLEN FRANKEL PAUL, JEFFREY PAUL AND FRED D. MILLER, JR. Oxford and New York: Blackwell for Bowling Green State University, Social Philosophy and Policy Center, 1985. Pp. 191. \$11.95. ISBN 0-631-14359-9. JEL 86-0355

This volume is a useful introduction to a literature mainly from the late 1970s on, which discusses the ethical background and implications of what might be called "moderately mainline" economic thought, stemming mainly from Pareto and welfare economics, somewhat interwoven with Rawlsian ethics. Amartya Sen and Alan Gibbard open the volume with discussions of the moral standing of the market and free exchange, with faint praise for the market, mainly because the alternatives seem to be worse. Reliance of the market on the institution of property, with its moral ambiguity, and the tendency of market theorists simply to assume away the distribution of property are brought out. The general conclusion seems to be that we need something beyond the market, but we are not quite sure what.

An interesting paper by David Gauthier on "Bargaining and Justice" suggests that there is a bargaining element in the development of a concept of social justice, but it does not explain very well how the bargaining is carried out. It does not discuss the importance of the widening of agendas in bargaining processes and neglects the tendency for "salient solutions," even if these are arbitrary. It also rather neglects the problem of benevolence and malevolence.

A somewhat different view is presented by John C. Harsanyi in "Rule Utilitarianism, Equality, and Justice." He distinguishes between "rule" and "act" utilitarianism, the rules

implying some sort of social bargaining, and brings out rather well the point that some justice is the price of workability of a system and that justice cannot simply be maximized. A long paper by Jules L. Coleman on "Market Contractarianism and the Unanimity Rule" brings out some of the implications of market patterns for political life and takes a rather dim view of unanimity as always promoting the status quo. I must confess I found the argument at times rather confusing.

Alexander Rosenberg has a sharp critique of economics for just assuming preferences, a point of view with which I have long sympathized, though he does not really tackle the problem of how preferences are learned and retreats into a rather vague concept of human needs, which are very hard to define.

The book ends with three articles in more applied fields. The first is a thoughtful critique of cost-benefit analysis by David Copp, who does not, however, come to grips with the necessity for overall evaluations through some sort of valuation coefficients. The book concludes with two articles of a remarkably different character on the evaluation of human life. E. J. Mishan gives a very sophisticated—and I have to confess, to this reader, rather incomprehensible—discussion of the impossibility of evaluating human life. And Dan Usher counteracts Mishan with a thoughtful article on the necessity for evaluating human life in some way if public decisions are to be made, and he even comes out with an approximate value of some \$750,000 (p. 191), I suspect a little tongue in cheek.

The book has some claims to be the product of what it is perhaps unkind to call a "coterie of co-citation." It is a group of authors who all quote each other and not many from outside the group. But what is left out certainly suggests that there is a certain narrowness of view. The equilibrium concept, which still haunts economics, in spite of the fact that equilibrium does not exist in the real world, dominates a great deal of the thought of this volume and prevents its authors from asking some of the most important ethical questions, such as: How do we evaluate overall processes in time?

There is no mention, for instance, of the "Matthew principle"—to him that hath shall be given—which suggests a profound instability

of inequality, not only in the market but also in political life. One of the great ethical problems is how this is to be offset. The Biblical "year of jubilee" (Leviticus 25:8-17), in which all debt should be forgiven and property redistributed, is hardly a satisfactory solution, and it is doubtful whether it was ever tried, but the problem haunts us even after 3,000 years.

There is no mention of grants economics, which may be another coterie of co-citation, but is certainly relevant to this volume. The discussion of alternatives to the market is very skimpy. A suggestion of Mancur Olson that "the market economizes agreement" (see Olson, *The Logic of Collective Action*, Cambridge: Harvard U. Press, 1965), certainly an important ethical aspect of it, is not even mentioned, and one emerges from the volume with the feeling that one has not been very close to the real world.

Nevertheless, this book is a sample of a body of thought which should not be neglected which does present challenges to other bodies of thought in this area. It is, one hopes, a contribution to getting isolated bodies of thought together.

KENNETH E. BOULDING

*Institute of Behavioral Science,  
University of Colorado-Boulder*

[PAZNER, ELISHA] *Social goals and social organization: Essays in memory of Elisha Pazner*. Edited by LEONID HURWICZ, DAVID SCHMEIDLER, AND HUGO SONNENSCHNEIN. Cambridge, New York and Sydney: Cambridge University Press, 1985. Pp. xii, 365. \$39.50. ISBN 0-521-26204-6. JEL 86-0992

Elisha Pazner's work covers virtually every facet of welfare economics, from wage indexation to environmental issues. The central concern of this book is the microeconomic modeling of distributive justice, to which Pazner's contributions are original and deep.

A volume in the memory of this remarkably productive scholar is a justified, albeit risky, enterprise. The editors chose to focus on Pazner's most theoretical papers on fairness and its many definitions (the subject where he was most creative) and solicited eight surveys of the "state of the art" in the most active areas of theoretical welfare economics. Their choice of authors and subjects is impeccable. Most of the contributors have done excellent scholarly

work, producing self-contained accounts of the main definitions and results, as well as guides to the recent literature. The volume is a complete success, widely cited already and an indispensable reference for graduate teaching. In discussing the nine original papers, I put forth some criticisms based on personal taste; these do not diminish my overall enthusiasm for this unique piece of collective work, which will remain a landmark for many years.

All papers fall into the broad subjects of distributive justice or mechanism design, and some of them (by Maskin and Postlewaite) link these two themes by means of the implementation concept.

Hurwicz' introduction sets the right historical perspective to the mechanism literature (as one would expect from its inventor!) but fails to integrate the distributive justice surveys (by d'Aspremont, Kalai and Thomson-Varian), an admittedly difficult task. It seems to me this introductory paper is really another survey in addition to the eight others.

The first theme covers the notions of social welfare orderings (and collective utility functions) and their extensions to the axiomatic bargaining framework. The papers by d'Aspremont and Kalai are very well done and much needed: they update conveniently Sen's 1977 survey papers and Roth's 1979 monograph.

The second theme treats concepts of fairness in resource allocation, mainly envy-freeness and its variants. Thomson-Varian's paper is short but neat (except for the section on incentives that is covered anyway and in greater detail by Maskin and Postlewaite). It provides a clear introduction to most of Pazner's papers reprinted here. It would actually make more sense to single out this paper at the outset of Part 2.

The third and principal theme is the strategic analysis of collective decision mechanisms. On this, the volume constitutes the most accurate reference to date. Four of the surveys (by Muller-Satterthwaite, Maskin, Myerson and Milgrom) are entirely self-contained, giving precise definitions and statements of theorems immediately usable in class. The two papers by Hurwicz and Postlewaite discuss the important issues and provide a guided tour of the literature; together they provide an excellent reading list, but will not help the novice much.

The four remaining papers are all very solid teaching material. The Muller-Satterthwaite paper provides a simple proof (due to Feldman) of the basic Gibbard and Satterthwaite result. The section on restrictive domains may be too long and too hard to read: some of the most technical results could easily be deleted. Maskin's survey on Nash implementation fills the vacuum left by his never published 1977 working paper. Myerson's exposition of Bayesian incentive compatibility is among the first systematic pieces on the subject. Finally Milgrom's survey, although written in 1981 (a similar survey by Weber appeared in the 1985 volume on Fair Allocation of the AMS), gives a fair account of one of the most successful applications of the Bayesian approach.

One final criticism concerns the title: it is vague and not very informative. But I am confident that it will not deter anyone from using and citing this outstanding volume.

HERVÉ MOULIN

*Virginia Polytechnic Institute and State University*

*Social choice and democracy.* By NORMAN J. SCHOFIELD. New York, Berlin and Tokyo: Springer, 1985. Pp. xvii, 321. DM 120.-. ISBN 0-387-15604-6. JEL 86-0667

Most economists are familiar with the idea that, if the set of alternatives can be viewed as a line (one-dimensional), if preferences are single-peaked and if social preferences are calculated by simple majority voting, then the social choice is easily determined: the social ordering has no cycles and there is an alternative (the median peak) that is at the top of this ordering. Competing political parties will then move us to this median peak alternative.

Less well known is how badly all this breaks down when the space of alternatives is "bigger." Suppose the set of alternatives is a plane (two-dimensional) and that simple majority vote is still the social choice procedure. It is possible to find very well-behaved preferences for which there is no top-most alternative in the social ordering. Now by itself, this need not be too serious. If there were only a cycle among the top three alternatives (the minimum number for cycling), and if these three were very similar and also unanimously preferred to all the other alternatives, we might be satisfied by an arbitrary choice from among the top three. Unfortunately,

we can find well-behaved preferences in this two-dimensional context so as to cause much more serious cycling. In fact, we can find such preferences so that *complete* cycling or "chaos" occurs: given any two alternatives,  $a$  and  $b$ , there exists a finite sequence of alternatives,  $x_1, x_2, \dots, x_n$  such that  $a = x_1$  loses to  $x_2$ , which loses to  $x_3, \dots$ , which loses to  $x_n = b$ . There would also be a sequence from  $b$  back to  $a$ , completing a cycle. Given the preferences and an initial alternative, a clever agenda setter who could lay out the sequence  $x_1, x_2, \dots, x_n$  of votes, could manipulate the group to any choice anywhere in the plane.

What is unfortunate for making social choices, however, is fortunate for social choice theorists, who find from that a richer set of possibilities for analysis. What has been studied so far are differences between results on "small" alternative spaces and results on "large" spaces. With simple majority voting, there is a sharp boundary; for dimension one, no cycling occurs while for dimensions above this number, there are preferences where global cycling or chaos occurs. This result was first obtained by McKelvey. His results were soon extended to more general social choice procedures called  $q$ -rules. Suppose with  $n$  voters there is a number,  $q < n$ , such that coalitions of size  $q$  or larger always win. Then Greenberg has shown that there is an important dividing line between small and large spaces of alternatives given by

$$v = \text{the smallest integer not exceeding } 1 + [n/(n - q)].$$

If the dimension of the space of alternatives is  $v$  or less, no cycling occurs with  $q$ -rules and there exists a best alternative; if the dimension exceeds  $v$ , there will be a profile of well-behaved preferences for which the  $q$ -rule yields a cyclic ordering with no best alternative.

Within this framework, Schofield has addressed two significant ideas. First, following some work that Nakamura did for the discrete case of finitely many alternatives, Schofield has extended the analysis to an even broader class of social choice procedures, the "noncollegial" voting rules. For such rules, there is a "Nakamura number,"  $v^*$ , based on the power allocated to different coalitions, that determines the boundary between small and large spaces

of alternatives. If the dimension of the alternative space is  $v^* - 2$  or less, no cycling occurs and there exists a best alternative; if the dimension exceeds  $v^* - 2$ , there are well-behaved preferences for which the social ordering is cyclic and no best alternative exists.

The second area of work is a more detailed examination of what happens in the cases when dimensions exceed  $v^* - 2$ . For example, when the dimension exceeds  $v^* - 1$ , more complicated cycling may occur than can occur in the  $v^* - 1$  case.

In *Social Choice and Democracy*, Schofield brings all this work together in a unified way and relates it to similar work in the case of finitely many alternatives. He presents all the technical apparatus (drawn from general topology, algebraic topology and analysis) required for him to state results with precision and to provide complete rigorous proofs. This is very valuable work, for which we must be thankful.

However, for the general reader, who may find these conclusions both interesting and important (e.g., as a warning about the use of the median voter approach in political economy), this book will prove very frustrating. Almost no allowance is made for those readers interested in the issues but unwilling to make an enormous effort to read a text drawing on difficult mathematics, presented in a relentless definition-lemma-theorem-proof-corollary format, where there is little motivation and few illustrative examples. Precision is confused with clarity throughout.

There is a lack of appreciation for explaining the value of generalizations that come at a high cost in complexity. (For example, the general reader needs some guidance on how significant is the class of noncollegial voting rules that are not also  $q$ -rules, and so on how important Schofield's extension is.) There is a pervasive need for concrete illustrative examples. (How many readers will be able to separate, without examples, "upper-hemi-continuity," "lower-hemi-continuity," "upper-demi-continuity" and "lower-demi-continuity"?) Motivation is often absent or oddly placed. ("Structural stability," presented and analyzed in Ch. 6 is shown to be an important idea for democratic theory in Ch. 8.)

Admittedly, my preference for mixing in motivation, illustrative concrete examples and sim-

plicity is a matter of taste. But I think it is a widely enough shared taste to significantly and unfortunately restrict the audience for Schofield's ideas almost to those readers already familiar with his articles. I am reminded of a disagreement among the mathematicians L. J. Mordell and Serge Lang. Reviewing Lang's *Diophantine Geometry*, Mordell wrote,

A general question that immediately suggests itself to the reader is what object an author has in mind when writing a book. Some have the true teacher's spirit or even a missionary spirit, wishing to introduce their subject to a wide circle of readers in the most attractive way. Such an author's treatment is essentially self-contained, the presentation is made as simple and complete as possible, and there is no undue generalization that would tend to make unnecessarily difficult the comprehension of the simpler and really fundamental cases; he is painstaking in his efforts to save the reader unnecessary and troublesome effort. When the subject makes undue demands on the reader, the author tries to give the reader some idea of the proof in easily understood language. (p. 493)

These are not criteria under which Schofield fares well.

Six years after Mordell's review of Lang's book appeared, the same journal had Lang review Mordell's *Diophantine Equations*. Lang defended his earlier work noting,

I see no reason why it should be prohibited to write very advanced monographs, presupposing substantial knowledge in some fields, and thus allowing certain expositions at a level which may be appreciated only by a few, but achieves a certain coherence which would not otherwise be possible. (p. 1234)

But Mordell has the better economic analysis: if the audience is very small, and if better exposition, motivation and illustration could, with relatively little cost in effort, have dramatically increased the audience to include many who would be interested, a loss has resulted. Mordell ended his earlier review with remarks that mirror my response to *Social Choice and Democracy*:

Lang assumes his readers are as knowledgeable as he is and can grapple with the subject with the same ease that he does. Even if they could, Lang's style is not such as to make matters easy for them. . . . Further thought and care about his book, before publication, would have been well worthwhile. Those who can under-

stand the book will be indebted to him for having brought together in one volume the important results contained in it. How much greater thanks he would have earned if the book had been written in such a way that more of it could have been more easily comprehended by a larger class of readers! (p. 496)

*Production, income and welfare: The search for an optimal social order.* By JAN TINBERGEN. Lincoln and London: University of Nebraska Press; Brighton, Eng.; Harvester Press, Wheatsheaf Books, 1985. Pp. xiii, 210. \$21.95. ISBN 0-8032-4412-6. JEL 85-0929

Rather rarely do economists state their ideals so frankly or make them so ambitious. These essays, which are all republications or translations of articles in danger of being lost, include a manifesto for an optimal world order, no less, particularly as regards the world economy. They will probably receive more attention from readers of this *Journal* who are also members of the European rather than of the American Economic Association. A pity, for as Kolm (1972, p. 17) observed, concerning Tinbergen's (1957) address to the A.E.A. meetings:

It is symptomatic that the presentation of its marvellous text to a public of American economists should have been 'a flop,' as theatre people say . . . that confirms what we always have thought: Americans are not interested in social justice, at least in the sense we mean in France (Léon Walras wrote earlier, "Justice is a Greco-Latin and French concept"); in particular, the notion of equality of outcomes—rather than of opportunities—has many fewer attractions for them than for us.

Another pity, one might add, is that Kolm's book *Justice et équité* remains untranslated, and that the above is my own imperfect effort.

Optimizing the social order implies maximizing a Bergson social welfare function subject to physical feasibility constraints. Part I accordingly treats production, especially some problems of estimating production functions, as well as "counterproduction" and various kinds of col-

lective or "part-collective" goods. "Counterproduction" is particularly interesting. When the estimated exponent of labor in a Cobb-Douglas production function is negative, this father of econometrics not only reports the result, but goes on to find a theory powerful enough to support almost any negative estimate of a marginal product. Unfortunately we are not told how the theory developed in one essay is meant to apply to the following empirical results which are reported in an earlier essay. It seems that those states in the U.S. in 1959, and those prefectures in Japan in 1975, which had more farm workers, also had significantly lower outputs, on average, when other inputs are held constant. For similar reasons, blue-collar workers in the U.S. appear to have had negative marginal products, and managers and professionals insignificant marginal products in both countries. These may not be negative *physical* marginal products of course, but may reflect that (possibly quite justified) deviations from first-best efficient production are more important in areas with more low paid farm or blue-collar workers. Such "distortions" are just one of the many forms of "counterproduction" which receive attention.

Part II's essays respond to criticisms of Tinbergen's (1975) earlier model of income formation and elaborate it further. Occupational status is included because it measures the effort needed to perform in (or qualify for?) one's position. It explains some of the variations in incomes. It is also claimed to help in explaining schooling, but I do not see how we know the results do not arise because schooling explains occupation. Another essay discusses Kolm's (1977) view that chief executives' high incomes are inexplicable without some degree of group monopoly power. Finally in this part, Essay 10 presents two approaches to measuring welfare with interpersonal comparisons. The first is the "indirect" or "revealed utility" approach based on compensating earnings differentials. Individuals are supposed to be free to choose their job characteristics—measured by required education and experience—which supposedly makes earnings differences which compensate for such choices equitable, while other differences are not. Even more questionable is the second approach based on several Dutch compatriots' extensive work calibrating welfare

functions on the basis of responses to questions rather like, "What level of income would make you feel (very) well/badly off?", with nine different gradations. This work has always puzzled me because I have little idea what the question is really supposed to mean, let alone the answers. Why not ask directly how much people would value redistribution of income, perhaps along lines suggested by Yaari and Bar-Hillel (1984)? Part III, on welfare functions, then actually provides more of a valuable discussion of what affects social welfare—income distribution, counterproduction, matching of workers' jobs to their capabilities, etc.—than it does of procedures for measurement.

Finally, in Part IV comes the optimal social order, with a detailed characterization of a first-best welfare optimum, including how levels of educational attainment should depend on innate ability, and the allocation of workers to jobs, as well as the usual efficient allocation of goods and services and the optimal distribution of income. Real flesh and blood, and numerical estimates, are added to the efficiency theorems of first-best, full information welfare economics, which are customarily rather lifeless. And there lies the problem—the lack of information needed to implement such optimal policies. As we read on page 40:

The dream of the perfect economy occupied many and had an enormous political impact. The attempts to implement it gradually showed its dream-like character. Even the economies of very small nations are too large . . . to observe all activities from one central point . . . Thus certain forms of counterproduction have to be accepted.

This was meant, I think, to apply to centrally planned economics, but I fear it also applies to Tinbergen's first-best dream of an optimal social order. Earlier, in Tinbergen (1975, p. 121), the problems of administering theoretically ideal taxes on (innate) capability, as a lump-sum tax, were recognized, if only briefly. Now they are not. But the fault is with welfare economics generally, which is only just beginning to come to grips with the theoretical and practical problems posed by privacy of certain

kinds of information that is needed for instituting first-best lump-sum taxes and transfers. Such privacy forces one to recognize "incentive constraints" which make most first-best allocations quite unattainable, and to see markets as constraints also, making it harder to achieve desirable second-best "distortions" in the economy.

Too many policy economists lose patience with irrelevant first-best theory and miss some improvements which are feasible, even if they fall far short of the unattainable first-best. They and their political masters might do us all a favor by sharing Tinbergen's dream of an optimal social order, even if they should also recognize why only second-best policies are feasible. We should all *hope* that future generations find the present chaos as incomprehensible as we find the theories of those mediaeval physicians who apparently believed that serious diseases could be cured by blood-letting.

Meanwhile, I hope we see more such books by Tinbergen, although one might prefer an extensive and reflective introduction that really relates the essays to each other, to the very brief foreward to this volume. And, future revisits to the optimal order (after Tinbergen, 1987) could pay more attention to problems of information.

030 HISTORY OF ECONOMIC THOUGHT;  
METHODOLOGY

*Foundations of economics: Structures of inquiry and economic theory.* Edited by MAURO BARANZINI AND ROBERTO SCAZZIERI. New York and Oxford: Blackwell, 1986. Pp. x, 454. \$49.95. ISBN 0-631-14253-3.

JEL 86-0998

The fourteen papers presented here explore the conceptual foundations of orthodox theory and the dynamics of change in economic knowledge. Subtitled *Structures of Inquiry and Economic Theory*, the essays elucidate the functional relationships between content and method. The orthodox position that there is a single, optimal analytic paradigm, that all others are essentially useless or false is rejected. The book's "fundamental theme [is] coexistence of [two] distinct lines of research since the beginning of our science" (p. 65). These are the exchange-oriented and the production-oriented theories.

Following an extensive interpretive introduction by the editors, the book is divided into four parts: Part I, "Perspectives on Economics and the Dynamics of Knowledge" (John Hicks and Bernard Schmitt); Part II, "The Core and Extensions of Exchange-Oriented Theories" (Maurice Allais, Michael O. L. Bacharach, Dieter Helm and Klaus H. Hennings); Part III, "The Core and Extensions of Production-Oriented Theories" (Nicholas Georgescu-Roegen, Michael A. Landesman, Alberto Quadrio-Curzio and Krishna Bharadwaj); and Part IV, "From the Ancients to the Moderns: A Reappraisal of the Dynamics of Change in Economic Theory" (Christopher Bliss, Alberto Quadrio-Curzio and Roberto Scassieri and Luigi L. Pasinetti).

The perennial tension between the "ins" and the "outs"—in contemporary United States orthodoxy, between "Fortune's favorites" (Solow 1985), mathematical and equilibrium-oriented econometrics and socially and historically-oriented "institutionalists"—is reviewed in the editors' opening statement. "Economists often attribute the existence of disagreement within their own profession to error and incompetence, if not to fraud [to conflict between those who] know economics, and . . . those who do not" (p. 1). The contrary position developed here is that economics "like most other disci-

plines, is in fact open to a variety of points of view, many of which may lead to distinct lines of research" (p. 1). Still, a question remains concerning the extent to which—and why—one viewpoint remains dominant for an extended period of time. For over a century, the dominant position of classical "production-oriented" economics has been supplanted by "exchange-orientation." Contemporary revival of variations on the production paradigm remain outside the pale of orthodoxy. They range from post-Ricardian neo-Keynesianism to Marxist and non-Marxist institutionalism.

A "line of research" is similar to, but different from both a Kuhnian paradigm and a Lakatosian research program. It may incorporate various combinations or sequences of "paradigms and programs." Appraisal of the alternative exchange and production research lines is based on their relatively "late stage of development, when each line has already been stretched to include most of the domain of economics" (p. 31). The two lines are compared in terms of seven aspects (or "objects") of economic analysis:

the nature of commodities considered; the 'vision' of the production process; the criteria of distribution; the role of social classes; the time-framework and economic growth; the role of accumulation; the types of causal relationships. (p. 31)

In general, the exchange line (the "catalactic" approach) is short-run and reductionist; the production line (the "political economy" approach) is long-run and holistic. Arguably, "the 'truth criterion' for 'catalactic' theories is mainly aprioristic, whereas it is *a posteriori* or inductive for theories of the 'political economy' type" (p. 44).

The contributions generally reflect a "political economy" perspective. Presentation is primarily literary. The more technical articles (Allais, Georgescu-Roegen, Landesman, Quadrio-Curzio and Pasinetti) incorporate a balanced integration of literary, diagrammatic and mathematical analysis. The concluding section and the final contribution, Pasinetti on value theory, represent a link to the possibility and implications of realization of a "late classical" renewal—the reestablishment of production alongside the now-dominant exchange line—and the possibility of a renewed dominance of

"political economy." Pasinetti considers the possibility of continued revival and application of the labor theory of value following the lead of Ricardo and Sraffa. The thematic base here is consonant with the perception of contemporary economics—and capitalist economics—as in a phase of fundamental transition. Revival and progress along the "production" line would work toward filling gaps in the economics of growth and welfare—in analysis of distribution of income and wealth and the qualitative elements of the national product (Robinson 1972). The substantive tradeoff, a shift from efficiency toward equity economics, would be paralleled by a methodological rebalancing from excessive rigor to greater relevance.

*The legacy of Ricardo*. Edited by GIOVANNI A. CARAVALE. Oxford and New York: Blackwell, 1985. Pp. x, 325. \$45.00. ISBN 0-631-13617-7. JEL 86-0034

The absence of a will makes it difficult for a reviewer to adjudicate the claims to Ricardo's inheritance made by the authors of the papers collected in this book; they do show that Sraffa's edition of Ricardo's *Works* has enhanced the value of the inheritance. The book opens with Mark Blaug's cautious warning against using one simple model to interpret every aspect of Ricardo's economics and closes with John Hicks' equally judicious warning about respecting the limits that Sraffa expressed concerning his own interpretation and extension of Ricardo. The other eleven papers are concerned with the "new views" (with respect to Sraffa's) of Ricardo. The editor divides these into the "neo-classical" approaches of Samuel Hollander, Carlo Casarosa, and Giacomo Costa, and those who attempt to integrate growth into Sraffa's approach: Giovanni Caravale, Domenico Tosato, Pier Luigi Porta, Annalisa Rosselli. An intervening section provides criticisms of both

from the perspective of Sraffa's approach by Pierangelo Garegnani, and Alessandro Roncaglia, who also usefully documents the similarities between the "new" views and those that were old when Sraffa's were "new." A final section deals with a problem that seems to have escaped the attention of all views, the machinery question, with Walter Eltis' presentations which also provide an interesting criticism of the new view, and Ferdinando Meacci who expands the list of Ricardo's legatees to include the neo-Austrians!

The essay by Annalisa Rosselli fits uneasily into its classification for it cuts across the contending new views, isolating what appears to be the point of contention amongst the heirs apparent: Ricardo's theory of wages. The non-expert would do well to read this directly after Blaug's essay.

The difference between the proponents of the "new" views appears to turn on the consistency of Ricardo's definition of natural wages in the "Essay on Profits" and in the *Principles*. In the former he assumed no changes in technique and constant real wages due to an equal rate of expansion of capital and population, while in the latter natural wages kept population constant. Thus the paradox: natural wages imply either a) a stationary population or b) population increasing at a rate equal to capital. If a) is accepted then the analysis of expansion is either impossible, or market wages must exceed natural wages until the stationary state. This is the Hicks-Hollander solution, which means that supply and demand determined market wages are of primary importance in all but the uninteresting stationary state. If Ricardo's insistence on the importance of natural values is to be made compatible with the analysis of growth, Caravale and Tosato (and in a slightly different way, Casarosa) argue that b) is the obligatory choice. But this contradicts Ricardo's belief that natural wages are variable, and requires an ad hoc assumption to assure the proper relation between the growth of capital and population. Rosselli's analysis suggests that neither seems to preserve the idea of natural values.

In evaluating these alternatives it seems important to note that neither the concepts nor the distinction between the natural and market wage appear explicitly in the "Essay." There Ricardo was concerned to elaborate his theory

of profits in terms of the newly popular theory of rent. Rather than developing the idea of the natural wage, he was more concerned to abstract from the effects that (technological improvement and) changes in wages due to a differential rate of growth of capital and population would have on profits because they had no systematic relation to the "natural effects" of economic expansion. Thus in order to isolate the effects of the expansion of capital, population and extension of production to inferior land, Ricardo eliminates these nonsystematic effects by making what we might now call a *ceteris paribus* assumption—that capital and population grow at rates which keep real wages stable (pp. 11–12).

There is, however, a very clear reference to what would occur if this constant real wage were doubled: the "natural limit to population would of course be much earlier" (p. 15). Here Ricardo appears to mean the stationary population which could be supported by the assumed constant real wage would be smaller because profits would be driven down to the point where accumulation ceased more quickly. This not only suggests the *Principles* definition of the natural wage, but also that he did not conceive of continuous expansion of either population or capital, that the assumption was made simply to eliminate the effect of wages about which "nothing can be positively laid down, respecting profits" (p. 23).

Thus while Ricardo certainly would not have rejected a "market" wage alternative, he clearly considered it as a sufficient but not a necessary explanation of the movement of profits. It would rather appear that as he worked on the *Principles* he realized that the increased costs of necessities due to diminishing returns, revealed in lower profits and increased rents, produced higher prices and wages that were incompatible with the assumption in his "Essay" of constant wages and prices. It also raised the possibility of differential movements in the prices of necessities and other goods, and thus the problem of explaining relative price movements as part of the argument that the rate of profit in agriculture set the general profit rate for the economy. But here we recover Sraffa's narrative of the central problem faced by Ricardo in the passage from the "Essay" to the *Principles*, and although the "corn model" does not appear to have been

absolutely necessary to its formulation, presenting it in this form certainly eases its resolution.

JEL 86-0042

Western economists probably know Preobrazhensky best as a prominent economist and state functionary on the left-wing of the Bolshevik Party during the 1920s' debates over development strategy. Although tame, relative to the unusually intense Stalinist strategies after 1928, Preobrazhensky, more than any other single individual, provided during the 1920s the economic content of the rationale for rapid, large-scale industrialization and a priority to investment in the process of "building socialism" (Preobrazhensky 1965). In the early 1920s, he had teamed with Bukharin—who was to become a major leader in the right-wing of the Party and advocate of strategies more accommodative to the peasantry and consumption (Elliott 1965)—in writing a popular book on socialism (Bukharin and Preobrazhensky 1921).

*The Decline of Capitalism*, is described by Richard Day as "one of the best works in Soviet economic theory" (p. ix). Although emerging out of Preobrazhensky's studies of the Soviet economy, the historical context in which he writes is that of the Western capitalist economies, their proclivities toward crises and depressions both in general and specifically during the late 1920s and early 1930s. His intellectual context is Marxist crisis theory, notably Marx' schemes of expanded reproduction. His central purpose is to examine how formal recognition of monopoly affects the classic Marxist analysis of crisis and cycle, which traditionally focused on competitive processes in Marx' works. Preo-

brazhensky roots the need for such a project in the shift from an "epoch of free competition" (prior to roughly the 1880s) and a "stage of monopolism" which has succeeded it (pp. 14-15).

Part One begins with an introductory comparative sketch of these two stages in capitalist structure. The commonality between them is market production for the purpose of profit by private producers. But the differences are also of powerful consequence. Competitive capitalism (1) is relatively "elastic" because of easy entry, thereby enhancing the robustness of cyclical expansions; (2) impells introduction of new equipment and improved technologies, which both lowers prices and forces eviction of backward firms, thereby facilitating adjustments to crises and depressions. Moreover, access to territories for new expansion is still relatively easy. Monopoly, by contrast, is much less flexible. Entry is constrained by both larger scale and monopolistic associations. Because of weaker competitive pressures, technological innovation is slower. Consequently, firms respond to reductions in demand by curtailing production rather than cutting prices (and to rising demand by raising prices to a greater extent than under free competition). In addition, the entire world has become divided, so that corporate behemoths "can only snatch from one another existing markets and spheres for the export of capital" (p. 19).

These basic ideas are extended and supplemented in the analytical core of the book, Parts Two through Four. First, in continuing his general remarks on competitive capitalism (in Ch. 2), Preobrazhensky observes that although the vigorous competition which impells reequipment and technological improvements intensifies cyclical downswings and depressions, it also, by evicting weak firms, reducing costs, and creating new markets, serves as an important basis for cyclical upturns.

Second, the tendency of monopoly to respond to falling demand by reducing output and employment is supplemented by an attempt to prevent entry of new firms in response to rising demand by expanding production by existing firms. But this requires substantial reserves of fixed capital. Thus, the "main evil of monopolism" is an "intensified thrombosis of the productive forces" (p. 33), manifested by

both higher unemployment and greater unused plant capacity throughout the business cycle.

As a consequence, Preobrazhensky continues (in Ch. 3-5), the timing and character of the cyclical process are also significantly affected. Precisely because of its proclivity toward building greater excess reserves of fixed plant capacity (instead of expanded entry by new firms), it is harder for cyclical recovery to develop into a robust, general expansion under monopoly capitalism. At the same time, however, the build-up in fixed capital reserves creates new markets and thus delays the crisis and cyclical downturn. Once the crisis does occur, as noted already, the enormous fixed capital reserves combine with diminished competitive pressure for reequipment and technological improvements, so that "economic recovery is rarely able to develop automatically into economic expansion" and "the emergence from a crisis must inevitably take longer and assume a more agonizing character" (pp. 74-75). (It should be noted parenthetically that Preobrazhensky does not characterize "the stage of monopolism" as the supersession of all competition. To the contrary, in a sophisticated discussion, he explains both that monopoly "does not and cannot eliminate competition" and that monopoly is not likely to lead to a workable "planned capitalist" economy; pp. 38 ff.)

Third, from a technical viewpoint, one of the most interesting aspects of Preobrazhensky's book is his reworking of Marx' reproduction schemes from a cyclical perspective. Although this does not go so far as the development of a formal mathematical model, notions of uneven development and cyclical process are illustrated insightfully by numerical examples in final summary comparisons (in Ch. 7 and 8) of competition and monopoly.

Remaining chapters, although less general and analytical, contain interesting commentary. Chapter 9, for example, uses the ideas developed previously to provide a characterization of the cyclical process in the United States in the late 1920s and early 1930s. Chapter 11 provides an early and provocative interpretation of fascism as a new form of state intimately connected with the shift from the era of free competition to that of monopoly capitalism.

The book is accompanied by a lengthy and very useful introduction prepared by its transla-

tor and editor, Richard Day, that situates Preobrazhensky's contributions within the setting of Marxist and Soviet economic writings on capitalist crises and cycles. Preobrazhensky's analyses are especially cogent when read against the background of interpretations of capitalism as afflicted by chronic stagnation based on underconsumption. Like Marx, he insisted in continuing to focus on cyclical models of capital accumulation, crisis, depression, recovery, and expansion, albeit modified by monopoly elements, a focus which, if anything, is more rather than less socially relevant today than in the early 1930s.

#### 040 ECONOMIC HISTORY

*Traders, planters, and slaves: Market behavior in early English America*. By DAVID W. GALENSON. Cambridge, New York and Sydney: Cambridge University Press, 1986. Pp. xiv, 230. \$34.50. ISBN 0-521-30845-3.

JEL 86-1014

David Galenson draws upon an impressive body of previously unexplored data from the records of the *Royal African Company* to support his analysis of traders, planters, and slaves in the West Indies. That is both the strength and weakness of this book. A strength because Galenson has provided an excellent analysis to go with the presentation of data; a weakness because he seldom ventures beyond the confines of the company records to the larger world in which it operated. What we have is a view—a very *economic* view—of the slave markets as seen by the company agents, captains, and planters who purchased the slaves.

Over the course of its sixty-year existence, the *Royal African Company* left a very detailed trail of its activities in the slave trade. Galenson uses two particularly valuable sets of records

for his study: the "Homeward Bound Invoice Account Books" which recorded data on the sale of more than 70,000 slaves between 1673 and 1723; and a "List of Ships and Their Voyages in the Service of the Royal African Company of England from November the 4th 1719 to 1733," which provided the details of 38 transatlantic voyages between 1720 and 1725 including information on the company's ships and their human cargoes.

The shipping data provide the basis for an econometric analysis of the mortality incurred on the infamous "middle passage." The results, however, are disappointing. After considering a number of possible influences, Galenson's regression analysis yielded only one variable—size of ship—that was considerably associated with higher mortality. It is not clear what to make of this. At the end of this chapter we are left with the rather weak assertion that there is "evidence of reasoned and systematic responses [by the company] designed to minimize the economic costs and risks" (p. 51).

Galenson next examines records of company transactions at auctions between 1673 and 1723. He presents data on slave prices and then uses this evidence to show how slave auctions were organized. The most noteworthy finding here is that the highest-quality slaves were typically sold first, and since the wealthiest planters tended to open the bidding, they got the best slaves. An interesting speculation would be that larger and wealthier planters might therefore enjoy advantages relative to smaller plantations through a higher-quality slave labor purchased at auction.

Galenson presents his most conjectural—and, I think, also his most interesting—findings when he turns to the question of planter persistence in Jamaica. Using presence at the regular slaves by the company as a guide, he constructs some indices of "persistence" among planters. In the 1670s, he argues,

Barbados had a low rate of voluntary outmigration, little higher than the rates found in a number of New England towns and villages. . . . After the 1670s in Barbados, . . . outmigration rates were considerably higher, with average annual rates generally double and often triple those found in the New England towns with the highest turnover rates. (p. 137)

Understanding this change in attitude, he feels, could provide an important clue to the eco-

economic rise and decline of the British West Indies.

In his final chapter Galenson turns to the reasons for the company's demise in 1732. It failed, he argues, in large measure because it was unable to enforce the monopoly granted by its charter. I suspect he is right, and that will warm the hearts of those who feel competitive market forces were working in the early eighteenth century. But at the same time, it points out the limited scope of Galenson's own analysis, which focuses almost exclusively on the company's activity.

One can admire, as I do, the care and ingenuity with which the empirical analysis in this book is carried out. This is the "metric" part of cliometrics at its very best. The data are critically scrutinized, the empirical tests are carefully conducted, and the results presented so as to avoid exaggerated generalizations. Yet, as I noted above, this is also the major weakness of the book. Though "clio" is first in the name of the profession, it plainly remains second in the hearts of practicing cliometricians such as Galenson. He does provide a historical backdrop to his examination of market behavior. And, among the myriad of numbers he has extracted from the company books, he also found numerous remarks by agents, captains, and company clerks to add a dash of color to his rather monochromatic quantitative picture. Still, the historical picture remains incomplete. In the final analysis that is because it is *market* phenomena, not *historical* phenomena that are the central focus of this study.

This shortcoming (and not everyone will see it as a shortcoming) aside, this book will intrigue theorists eager for new tests of their theorems, as well as quantitative historians eager for new data relating to seventeenth-century slavery. That makes it a very worthwhile effort.

#### 050 ECONOMIC SYSTEMS

*Contributions to Islamic economic theory: A study in social economics.* By MASUDUL ALAM CHOUDHURY. NY: St. Martin's Press, 1986. p. xvii, 241. \$29.95. ISBN 0-312-16881-0.

JEL 87-0050

Professor Choudhury, a very able economist indeed, has produced one of the most rigorous

and mathematically sophisticated books ever written on Islamic economics. This work, I am positive, will enhance the recent attempts by various proponents of Islamic economics whose purpose is to create a modern and scientific framework for the economic concepts of the Islamic religion. It is worth mentioning that, traditionally, very few secularly trained economists with an Islamic background—especially with the degree of sophistication in economic theory that Professor Choudhury has exhibited—have been attracted to the cause of an economics whose central issue, as Choudhury suggests, is "efficient allocation of resources in the light of a righteous community promoting the laws of God on earth" (p. 7).

His stated goal for writing this book is twofold: to introduce Islamic economics theory by utilizing various technical tools of economic science, and to argue that Islamic economics should be treated as a special case of social economics. He tries to accomplish this in four parts—altogether twelve chapters.

In the first part he proposes three major principles of Islamic economics and discusses the key policy instruments that put these principles to work. The principles include the principle of Tawheed (oneness) and brotherhood, which leads to "equality"; that of proportionality of work and its compensation; and that of distributional equity. The key policy instruments are: the abolition of *riba* (interest); the institution of *mudarabah* (Islamic profit-loss-sharing system); the abolition of *Israf* (wasteful consumption); and the institution of the Islamic tax *Zakat*. The principles and policy instruments are used throughout the book.

In Part II, he tries, in a rigorous and mathematical way, to develop microeconomic foundations for Islamic economics. Based on constraints imposed by the Quran and other Islamic sources, his principles, and his interpretation of them, he develops an Islamic theory of demand, the first order efficiency conditions of the firm in an Islamic economy, the impact of *Zakat* on resource allocation, *mudarabah* and its efficiency, microeconomic decision-making in Islamic economics and an Islamic welfare economics.

In Part III he discusses macroeconomic foundations of Islamic economics. First he develops an Islamic investment theory in which a normal rate of profit replaces the interest rate. Then

an Islamic macroeconomic consumption function is developed from its microeconomic roots. Finally, he discusses the general equilibrium relations of the Islamic macroeconomic model, and the IS-LM schedules. But, because of the replacement of interest by the rate of profit and the profit-loss-sharing mechanism, his Islamic IS-LM schedules are very different.

In Part IV he tries to show that Islamic economics is a special case of social economics. He regards it as a special case of social economics because, to him, "it lays the foundation of a non-homo economicus society in which individuals would interact and social relationships would be established on the basis of ethical dealings thoroughly pervading the realm of economics" (p. 199). At the end of Part IV, he tries to build a general equilibrium model based on the microeconomic concepts of Islamic economics.

Professor Choudhury's task—whether in the nontechnical discussions of Part I or other highly mathematical parts—is not an easy one. In spite of the depth of his analysis and his vast knowledge of Islam, he cannot escape the difficulties that any serious writer on Islamic economics would face. Part of it has to do with his choice of "major principles of Islamic economics." Because there exist various sources of Islamic economics, because there have existed numerous sects and different ideological persuasions and debates among Muslim scholars, his choice of principles are arbitrary. Others may choose more, or less, principles, and different ones. For example, Ahdul-Rauf has chosen ten principles (commandments). Besides, his interpretations of the ones he has chosen may not be the same as others. For example, why should his first principle lead to equality among Muslims while various Quranic verses accept inequality? He has to justify the selection of these principles.

The second difficulty he faces concerns the difficulty of providing a scientific framework for a set of religious beliefs (dogma). It is no wonder that some of the most important proponents of Islamic economics—Bani Sadre and Taleghani of Iran and M. B. Sadre of Iraq—have argued that Islamic economics cannot be a science. Thus, in order to impose a scientific framework on Islamic economics, he often has to adhere to sweeping generalizations or over-

simplifying assumptions. A case in point is the rather modern assumptions that he imposes on the Islamic firm. Another example is his assumption that Zakat is primarily a tax on idle wealth and, thus, is conducive to reducing X-inefficiency, a rise in investment and a positive multiplier effect. Muslim theologians and scholars have always regarded Zakat to be a tax on various forms of wealth and income, and, thus, it cannot accomplish what Choudhury claims it would.

In spite of these and other difficulties, this is an excellent book on Islamic economics. It is also a great exercise in adding ethical and moral dimensions to economic analysis. Thus, on balance, it is a positive contribution to the field.

HAMID HOSSEINI

*King's College, Pennsylvania*

*Contradictions and dilemmas: Studies on the Socialist economy and society.* By JÁNOS KORNAI. Translated by ILONA LUKÁCS, JULIANNA PARTI, BRIAN MCLEAN AND GYÖRGY HAJDÚ. Cambridge, Massachusetts and London, England: MIT Press, 1986. Pp. ix, 165. \$15.00. ISBN 0-262-11107-1.

JEL 87-0062

This volume is comprised of seven essays on tradeoffs among objectives of policy makers and reformers. While the primary focus is Hungary and other socialist economies, comparative methods are used, and implications for capitalist economies are drawn. The essays, first published in English between 1979 and 1983, are addressed to a wide audience of academics, policy makers, and interested laymen.

In the first essay, a presidential address to the Econometric Society, Kornai contrasts resource-constrained and demand-constrained systems. Firms in both systems are assumed to strive to increase production. Under "classical" capitalism (as described by Marx and Keynes), firms fear to expand production beyond expected demand because they face "hard" budget constraints, i.e., the possibility of bankruptcy if revenue fails to cover expenses. Under classical socialism (e.g., Hungary before its 1968 reform), firms operate under a "soft" budget constraint, i.e., they expect to be able to adjust their finances to expenditures, frequently with state assistance. Consequently,

firms produce as much as physical resources permit. In both systems frictions in resource allocation create a tradeoff between shortage (excess demand for some goods or factors) and slack (excess supply). Kornai expects a predominance of shortage in resource-constrained systems and slack in demand-constrained systems. The macroeconomics of a resource-constrained system is illustrated by a hydraulic analogy: Firms suck an input "reservoir" nearly dry. A trickle of goods leaks from a reservoir intended for consumers into the input reservoir. Price increases reduce the purchasing power of consumers but not of firms. Leakage between the two reservoirs makes inflation an ineffective antidote to shortages of consumer goods. This denial of a tradeoff between the price level and shortage deserves empirical testing.

The second and third essays explore the origins of soft budget constraints. Bankruptcy of a large firm would impose losses on large numbers of employees, creditors, and suppliers, who form a powerful lobby for state assistance to the endangered firm. Governments in socialist countries (and to a lesser but increasing degree capitalist countries) find that it is impolitic to allow large firms to collapse; therefore they adopt a "paternalistic" attitude toward them, softening their budget constraints.

The fourth essay traces the reciprocal influences of market conditions and attitudes. "In a shortage economy the buyer feels himself defenceless and subordinated, while the seller develops a consciousness of power and dominance" (p. 63). However, consumers will tolerate only limited amounts of shortage. If these limits are exceeded, labor productivity and public support for policy makers may decline. If policy makers are not continually attentive to these limits, they may periodically overstep them, inducing cyclical fluctuations in the composition of national income. Because policy makers, like everyone else, are only boundedly rational, they cannot simultaneously attend to all constraints.

The fifth essay comments on Hungarian economic reforms in 1979-82. These reforms entailed a price revision and, in principle, a hardening of budget constraints. The revision would have affected the profitability of state enterprises if budget constraints had indeed been hardened. But taxes and subsidies were ad-

justed to offset the effect of the revision on profitability. There is almost no correlation between profits of state enterprises before and after taxes and subsidies. Kornai infers that the budget constraints of state enterprises remain quite soft. However, a move in 1982 to break large enterprises into smaller units and found more small enterprises may reduce enterprises' lobbying ability and thereby eventually harden budget constraints. Shortages have been alleviated by relaxation of restrictions on cooperative and private enterprises but exacerbated by an export drive aimed at reducing foreign debts.

In the sixth essay, Kornai asks to what extent it is possible to harmonize the principles of efficiency and socialist ethics. He finds conflicts between them in three areas. (1) Bonuses based on profits under hard budget constraints strengthen incentives and foster careful calculation, thereby increasing efficiency. But such bonuses vary with exogenous conditions as well as the efforts of enterprise members, thereby violating the socialist principle of equal pay for equal work. (2) Liquidation of inefficient firms frees resources for more productive uses. But the resources include workers, who should be protected from job loss in the interest of solidarity and security. (3) Decentralization of investment stimulates efficiency by promoting flexible adjustment of production to changing conditions, giving scope to entrepreneurship, and making decision makers assume responsibility for their actions. But decentralization exacerbates problems of externalities and thereby clashes with the socialist principle of placing general before partial interests. From these conflicts, Kornai concludes that it is impossible to create a system that would be both fully efficient and ethical.

In the last essay the author explores analogies between economics and medicine. Inflation, unemployment, shortage, excessive foreign debt, growth disturbances, and bureaucratization are the chief diseases of economies. No economy is entirely free of all diseases. Radical treatment of one disease often has unwanted side effects, as when strong anti-inflationary measures lead to unemployment. After an acute attack of a disease a predisposition to relapse may remain, as when inflation is checked but inflationary expectations endure. A therapy that

is suitable in one "risk situation" may be inappropriate in another.

This volume, like all of Kornai's works, is insightful, original, carefully reasoned, well-balanced, and highly relevant to practical problems. What distinguishes it from his previous books is its lively, nontechnical style. As a teacher of comparative economics, I have long wished for a book presenting Kornai's views in a manner accessible to undergraduates. This is it.

# 100 Economic Growth; Development; Planning; Fluctuations

## 110 ECONOMIC GROWTH; DEVELOPMENT; AND PLANNING THEORY AND POLICY

[STREETEN, PAUL] *Theory and reality in development: Essays in honour of Paul Streeten.*

Edited by SANJAYA LALL AND FRANCES STEWART. New York: St. Martin's Press, 1986. Pp. xii, 291. \$29.95. ISBN 0-312-79726-5. JEL 86-1044

This festschrift is a fitting tribute to Paul Streeten, who has made major contributions to several areas of development economics over the last four decades. While the fourteen papers contained in it address a variety of issues and have different perspectives, they share Streeten's interests and methodology, which are described in Hugh Stretton's opening essay. Streeten has been critical of neoclassical theory because of its lack of realism, neglect of social and political institutions, over-mathematization, and attempted side-stepping of moral issues; he has not had much faith in the efficacy of free markets and has been deeply concerned with the problems of poor people and poor nations.

The majority of the papers deal with open economy issues. Several contributions in this category are on trade theory and policy. Jagdish Bhagwati and Richard Brecher use the standard  $2 \times 2 \times 2$  model of neoclassical trade theory to derive the heterodox results that capital inflows may be immiserising for an open economy, and that trade can hurt a capital importing country. Sanjaya Lall applies the traditional theory of comparative advantage to explore to

what extent developing countries can export traded services, but takes into account the fact that comparative advantage is not static, and can be made to change over time by government policy. Gerald Helleiner reports on regression analyses that show that import stability, rather than the degree of export orientation, affects the growth performance of African LDCs, thereby questioning the validity of the standard export-led growth proposals. Both the Bhagwati-Brecher and Helleiner papers can be thought of as critiques using the methods of those being criticized. But they are controversial precisely because of that: for example, if export orientation helps growth through its effect on capital accumulation, Helleiner's results could still be consistent with standard advice, and if the economies which Bhagwati-Brecher consider face a given terms-of-trade instead of a variable one which is assumed in the paper, they would benefit from capital inflows.

Three papers deal with the world recession. Those by Wilfred Beckerman and Michael Lipton that analyse global stagflation are among the most interesting in the collection. Beckerman argues that advanced economies have managed to reduce their inflation rates by reducing their growth rates. But this has occurred only because they did so collectively, thereby reducing the world demand for LDC commodities and their prices, which allowed imported inflation to be controlled, rather than by weakening the position of workers by increasing unemployment. The analysis uses a Kaldorian perspective on the world economy, and questions the restrictive policies of advanced economies because of their impact on LDCs. Lipton compares the recent crisis due to the rise in the share of oil rents to the Ricardian analysis of a profit squeeze due to a rise in the share of land rents in nineteenth century England. The analysis is useful in stressing the importance of relations between classes and the role of demand in the recent crisis. Finally, the late Carlos Diaz-Alejandro compares the experience of Latin America in the early 1980s to that during the 1930s, emphasizing the role of contrasting features of the international political economic situation in the two periods.

The remaining papers on open economy issues consider other aspects of economic relations between nations. Frances Stewart and

Nurul Islam provide excellent surveys on North-South negotiations and the stabilization of world food supplies, respectively. Stewart's paper is particularly interesting in examining why the negotiations have failed, and in suggesting feasible strategies that the South could adopt to negotiate more successfully. Mahbub ul Haq's paper proposes the creation of an IMF debt refinancing subsidiary for dealing with the international debt problem, and Deepak Nayyar's finds similarities in the pattern of trade between nonsocialist LDCs and developed socialist economies, and North-South trade.

Only two essays deal with purely domestic issues. Keith Griffin presents data on rates of growth of production and productivity, and using simple reasoning, dispels the widely held belief that communal land tenure systems in socialist economies perform poorly in comparison to individual tenure systems in market economies; a fuller analysis would have required comparisons of productivity levels as well. Jeffrey James uses alternative theories of managerial behavior to show why the choice of technology in Tanzania's public enterprises does not conform to the declared objectives of the government. While the analysis is valuable in understanding why problems of implementation arise at the bureaucratic level, a more complete analysis would also have to explore the nature of the state and the political constraints within which it operates that affect policy formulation.

A more general essay written by Amartya Sen in the delightful style that is a trademark of his writing, argues convincingly that Adam Smith did not claim either that individuals are driven only by selfish motives or that *laissez faire* is the best policy.

While a *festschrift* need not have any specific objectives, the title of this one might suggest that this is a comprehensive book on development economics. Indeed, it does cover a wide range of topics on the subject, and as such would be a good candidate for supplementary reading in courses in development economics. That recommendation is made subject to three caveats. First, the coverage of topics places too little emphasis on domestic issues, both in relation to what is usual in the development literature in general, and in Streeten's work in particular. Second, many of the papers lack rigorous

theoretical analysis and rely instead on vague and casual generalizations. This has the virtue of making the book accessible to noneconomists, but may serve to reinforce the unwarranted belief that analyses emphasizing institutions and structures cannot be mathematical or at least rigorous. Finally, the views expressed in most of the contributions will seem to be excessively heterodox to those who would like to apply only neoclassical economic theory to the study of development problems, and who extol the virtues of free markets. But it is precisely this quality that makes this book a healthy antidote to the recent spate of books on development economics written from a mainstream neoclassical perspective.

#### 130 ECONOMIC FLUCTUATIONS; FORECASTING; STABILIZATION; AND INFLATION

*Years of recovery: British economic policy 1945-51.* By ALEC CAIRCROSS. London and New York: Methuen, 1985. Pp. xiv, 527. \$59.95. ISBN 0-416-37920-6. JEL 86-0089

The Labour Government came to power in 1945 with ambitious plans to nationalize the basic industries and to introduce measures of social welfare. The economy had to be turned over from war to peacetime activities, a transition accomplished on the whole with remarkable smoothness, but punctured nevertheless by a series of economic crises. During the period covered by his book, Sir Alec Cairncross was for three years economic adviser to the trade and industry ministry (the Board of Trade), and for another year chief economist at OEEC, by then set up in Paris to administer the Marshall Plan. He was thus close to (though, as he explains, not mainly concerned with) macroeconomic policy in the period he now discusses. Later he was economic adviser to the Government and head of the Government economic service—appointments that give additional authority to what he writes.

In part his book incorporates new material from the official records, now available under the 30 years rule. These do not add greatly to the story already known, but reveal what went on at the official level, and between ministers and officials. The book thus retains the view-

point of one who was there at the time. The more novel parts of the book are presented as studies in policy making, and for this purpose Sir Alec has concentrated on times of crisis. The book, therefore, is not a consecutive account of developments. It says little about years when there was no crisis, which was about every other year. Since most of the crises had to do with the balance of payments, most of the discussion is about external policy. Domestic policies are then discussed in a series of chapters on such topics as planning and controls, fiscal policy and nationalization. Some of these draw heavily on existing studies.

One result of scrutinizing the official record is to make the fallibilities of government obvious to all. This is not completely fair: a valet has always been in a good position to observe the failings of his master. Sir Alec may be right in suggesting that this government was singularly ill-prepared for the economic problems it was to face. But the problems were both new and large.

The most vivid impression of ministerial inadequacy is perhaps provided by the negotiations for the American Loan in 1945. The end of the war with Japan, and consequently of Lend-Lease, left a yawning gap in the balance of payments: hence the need for a loan. It was Keynes who played the dominant part both in shaping the proposals put to ministers, and in conducting the negotiations. "Unfortunately there was a wide gap between Keynes's presuppositions and those of Ministers, most of whom had had little time to acquaint themselves with the complexities of the issues" (p. 89). There was an equally wide gap between what Keynes hoped for and what he could get. The loan eventually granted seems in retrospect relatively generous, though it lasted less long than expected. Sir Alec devotes another long chapter to the "convertibility crisis" of 1947 when the American loan ran out. On the basis of a detailed postmortem, Sir Alec concludes that though the convertibility of sterling (on which the US had insisted as a condition for the loan) had in fact little to do with the crisis, it was nevertheless as well that convertibility was suspended. (It is one of the oddities of the book's structure that little is said of the origins of Marshall Aid, which was to finance subsequent payments deficits.)

The chapter on the 1949 devaluation of ster-

ling (which appeared in substantially the same form in Cairncross and Eichengreen, *Sterling in Decline*, Oxford: Blackwell, 1983) gives an interesting account of the internal discussions. Devaluation was resisted by senior ministers, in particular Cripps and Attlee: to a Government wedded to planning, such resort to the price mechanism did not come naturally. The decision was made by a small group of junior ministers, notably Gaitskell: but it was delayed to the point of being widely expected. It would have been interesting to have been told the basis on which so large a depreciation as 30 per cent was estimated to have been appropriate. In fact most other industrial countries devalued on a smaller scale (which appears not to have been foreseen), so that the effective depreciation of sterling was of the order of only 10 per cent. The most important effect was therefore to appreciate the US dollar by the back door. A world-wide realignment of currencies of this sort was a major step toward international balance. Was it really unexpected—by the UK, the US and the IMF? It would have been interesting to know more.

On the fall of the Labour Government at the end of 1957, the new Chancellor (Butler) was presented with a proposal which went by the code name of "Robot." This proposal by a senior group of Treasury and Bank officials was to make sterling convertible forthwith, and take the strain on the exchange rate which was now to be allowed to float. That would have forced priority to be given to the balance of payments over domestic objectives of policy and have meant generally more restrictive policies. The hope was to put the plan into effect in very short order; and budget day was advanced for this purpose; but the Cabinet hesitated, and then grew cool. Sir Alec's account of this affair (which, strictly, falls outside his time limits) is probably the fullest available. He concludes, correctly in my view, that the plan would have been unwise. He provides, in effect, a study in the pathology of policy making.

The years of the Attlee Government saw the incorporation of Keynesian budget making and macroeconomic forecasting into the official machine; it is interesting to have Keynes' own reaction (p. 414) to this in its early days ("The forecasts were too contentious . . . he was against fine tuning. . . . It was wise to err on the safe side by allowing some inflationary pres-

sure"). It was also a period when the government attempted to rule without the assistance of monetary policy. Though that is not much discussed by Sir Alec, he devotes an interesting section to Dalton's attempt at ultra-cheap money—by no means as unorthodox then as it would be now.

The conclusion of the book is not well resolved. Sir Alec's account points repeatedly to weaknesses, both small and large, on the part of most members of the government. Yet his final conclusion is:

All in all, the early post-war years presented the government with a much more difficult task of economic management than the two decades that followed; and its mastery of the task entitled the government to all the more credit . . . those years appear in retrospect . . . as years when the government knew where it wanted to go and led the country with an understanding of what was at stake. (p. 509)

That praise is too high. Other countries, following different policies, also recovered from the war; most was due, here and elsewhere, to the natural regenerative power of private enterprise. Arguably the government's policies helped more than not; but it had to learn painfully, as left-wing administrations often do.

J. C. R. Dow

*National Institute of Economic and Social Research, London, England*

*The overburdened economy: Uncovering the causes of chronic unemployment, inflation, and national decline.* By LLOYD J. DUMAS. Berkeley, CA and London: University of California Press, 1986. Pp. xiv, 297. \$18.95. ISBN 0-520-05686-8. JEL 86-1056

Lloyd Dumas divides what is conventionally measured in the GNP into three types of activities—contributive, neutral, and distractive. Contributive activities are those goods and services that contribute to the quality of life, neutral activities (such as excessive private bureaucracy) absorb resources but do not produce goods and services, and distractive activities (such as religion or defense) absorb economic resources to produce noneconomic outputs. The author argues that the slowdown in U.S. productivity growth can be traced to the production of too many neutral or distractive goods and services that have drained resources,

mostly scarce scientific resources, from the contributive sector of the economy. To produce a healthier economy with more growth, less unemployment, and less inflation, the United States must restructure itself to reduce the demand for neutral or distractive goods and services.

If the United States continues on its present path, the rates of inflation and unemployment from which we suffered at the end of the 1970s—rates that were viewed as horrific at the beginning of that decade—will look like economic good times compared to what will be commonplace by the early 1990s, not to mention the turn of the century. Productivity growth will continue to deteriorate; real income, and thus (the) material standard of living, will begin an accelerated decline. (p. 236)

[While the] contributive sector operates primarily according to market principles toward what are clearly economic goals . . . (t)he neutral sector is to a much greater extent driven by sociological and psychological factors (mainly related to the operation of bureaucracy) in the pursuit of personal power and status by the key decision makers involved. Activities in the distractive sector, on the other hand, are likely to be motivated by political considerations, though psychological, religious, and general cultural factors may well play a significant role. (p. 154)

These powerful forces have simply made the neutral and distractive sectors too big, according to the author.

While this book flirts with the idea that individuals may buy distractive goods and services ("fancy cars, superstereos, and expensive clothes, while they may provide a kind of narcotic rush, bear no necessary relation to lasting happiness or deep feelings of personal fulfillment"; p. 48), most of the analysis focuses on defense as the major distractive burden weighing the economy down.

When it comes to neutral activities there is an internal contradiction that illustrates the book's fundamental problem. Work is viewed as more than a way to earn income. "A paying job is in itself a source of personal worth" (p. 38). It creates benefits—"psychological (creativity, satisfaction); sociological (interpersonal contact, a sense of belonging, status); and narrowly economic (the means for satisfying material needs or wants)"; p. 40). These noneconomic benefits from work are so important that it is legitimate for a society to "place equalizing tariffs—equal to and no higher than those costs (the extra costs of producing goods and services

with 'good' jobs rather than narrowly economic jobs)—on foreign producers, to avoid unfairly disadvantaging domestic industry" (p. 181). Yet it is illegitimate for managers to attempt to raise the noneconomic benefits of their jobs by increasing the number of managers that report to them. Workers can legitimately add long coffee breaks to the production process if it adds to their enjoyment but managers cannot add managers to the production process even if it adds enjoyment to their part of the production process. Why?

Implicitly Lloyd Dumas is willing to distinguish between legitimate and illegitimate preferences. While each of us has our own beliefs regarding the legitimacy of other people's preferences there is a real problem with how we translate these personal judgments into social judgments that can be legitimately used to force individuals or groups to change their behavior.

Lloyd Dumas simply assumes that there is more social agreement than there is—"all individuals can agree on which goods are contributive" (p. 151), "once we can at least roughly agree on the primary purpose of the distractive activity (defense)" (p. 251). What do we do if there is no agreement regarding how much defense is enough or which activities are contributive and which are neutral or distractive? Although I personally agree with many of Lloyd Dumas' answers to these questions, I suspect that many, perhaps even a majority, do not. What is to be done then?

The author rules out the one possible answer. If Americans want more defense and he is right that defense spending is draining the civilian economy, then the right answer is to retune the economy to increase the supplies of those resources (principally scientific manpower) absorbed by defense but needed by the civilian economy. But Dumas argues that "there is an upper limit to the pool of scientists and engineers potentially available to a society over time as well as at a given time. This pool is not likely to be large, compared to the needs of a vigorous, modern technology-based economy" (p. 186). I suspect that this judgment is not correct, but if it is correct, then the author has no solutions to the problems raised.

LESTER C. THUROW

*Massachusetts Institute of Technology*

*The quest for economic stability: Roosevelt to Reagan.* Second edition. By HUGH S. NORTON. Columbia, SC: University of South Carolina Press, 1985. Pp. xvii, 329. \$19.95. ISBN 0-87249-456-X. JEL 86-0720

In January 1986 the Joint Economic Committee (JEC) of the United States Congress held a symposium and dinner to mark the 40th anniversary of the committee and of the Employment Act of 1946, which created the Committee and the President's Council of Economic Advisors (CEA). The friends and supporters of the Employment Act were invited to the dinner. A good-sized crowd of warm, friendly public officials, business leaders, and other distinguished leaders attended. The dinner gave me the opportunity to reminisce about the Kennedy Administration with the guests, among whom was Hugh Norton, who, in this book, focuses upon the peaks and valleys of CEA and JEC influence under the Employment Act.

Hugh Norton, I, and others seemed to agree that the heyday of the CEA, the peak of its quality and power, was under the chairmanship of Walter Heller (1961-64), who had the good sense to team up with James Tobin (1961-62), Kermit Gordon (1961-62), Gardner Ackley (1962-64), Otto Eckstein (1964-66), and Arthur Okun (1964-68). John Kenneth Galbraith wrote a steady stream of letters to President John F. Kennedy while Galbraith was serving as U.S. Ambassador to India. The letters were "made interesting or vulgar enough to ensure his [JFK's] attention" (Galbraith 1981, p. 400). Perhaps most important, the staff economists of the Heller CEA were arguably the best ever; many, such as Robert Solow, James Duesenberry, Charles Schultz, and Lester Thurow, would be in the economist's Hall of Fame were it to exist. At the beginning of the second year of the second term of an allegedly conservative Republican president, the comments of our Senate dinner companions, Heller's masterful speech, and the reverence accorded the Employment Act of 1946 seemed sensible and oddly enough, relevant.

As Leonard Silk explains in his foreword to this lively, fascinating book, the (then) new knowledge upon which the Employment Act of 1946 was based was the doctrine embodied in John Maynard Keynes' Great Depression an-

tidote, *The General Theory of Employment, Interest, and Money*. Government "had it in its power to create enough demand for what the nation could produce, so as to provide jobs for all" (p. xi). President Ronald Reagan—unlike John F. Kennedy who used mild Keynesian doses of expenditure increases and a tax cut proposal—went to the well twice with Keynes. Reaganomics, or "supply side" economics, early in the first term ended up using reverse Keynesianism to cause the greatest economic downturn since the Great Depression. The best thing that can be said about that experiment is that inflation slowed. Reagan, the pragmatist, used Keynesian budget deficits to pull the economy out of depression, something that President Franklin Roosevelt could not or did not do during the 1930s. As Norton observes, Adolph Hitler ended the Great Depression, and Ronald Reagan has been characterized as the "ultimate Keynesian."

All of which brings us back to the Senate dinner. Despite President Reagan's right wing rhetoric about getting the government off the backs of the poor, and his threat to shut down the CEA, the principles of the Employment Act, passed by Congress to place responsibility on the Federal government for continuing policies for the promotion of maximum employment, production, and purchasing power in order to avoid a repetition of the Great Depression ultimately were sustained, even taken for granted by the Congress. Moreover, the great economic decline of 1981–1982 revived Keynesian anti-Depression policies at a time when Keynesianism appeared moribund. The Reagan Administration used the greatest budget deficits and the fastest monetization of debt in history (of any nation) to stop the fall.

Norton begins his accounts of twelve presidents and their economic advisors with Harding and Coolidge, both of whom worshipped business and detested the government they were elected to lead. In a typically lively account, Norton identifies Coolidge's frequent luncheon guests (and probable economic advisers) which included J. P. Morgan, Jr., Clarence W. Barron of *Barrons*, and W. H. Grimer, editor of the *Wall Street Journal*—all able men, but hardly unbiased in their views on government regulation of industry. The veneration of business ex-

plains the tariff acts of these administrations that were aimed at keeping purchasing power at home, but ultimately were to be contributing causes of the Great Depression.

Herbert Hoover receives deservedly better treatment. Much of Hoover's anti-Depression program was enacted during the famous first hundred days of the Roosevelt Administration. Hoover, like Keynes, worried about business confidence. The Hawley-Smoot Tariff Act continued the protectionist tendencies of the Coolidge administration. A half century has passed; Reagan and the U.S. Congress recently have proposed (and enacted) more new trade restrictions in misguided attempts to save certain industries or even specific firms. (Better policies would aim at easing the human burdens of structural change rather than trying to prevent it.)

The chapter on Roosevelt illustrates Norton's winning style. The reader is given enough biographical material to maintain interest and at the same time to reveal the president's motivations. No wonder that Roosevelt is Reagan's hero; the earlier president also was able to reverse direction, from an attack on Hoover for excessive deficit spending to the New Deal welfare measures that eased American's burdens throughout the Depression. The central difference; Roosevelt's "Brain Trust" really did understand economics, even though he (like Reagan) viewed the subject with studied indifference.

The ideas and approaches of remarkable personalities continue with the chapter on Truman who signed but did not shape the Employment Act. Many years ago the late Edwin G. Nourse, the first CEA chairman, related to me the difficulties he experienced with a president who expected even professionals to be politicians. The political innocence of the CEA ended with Nourse's resignation, a result of Nourse's inability to speak forcefully for a CEA he nominally headed but for which Leon Keyserling, a lawyer and CEA member, was Truman's policy advocate.

Keyserling's activist policies as CEA chairman nearly ended the Council. As Norton observes, Gabriel Hauge convinced President Eisenhower to ask for continued funding despite considerable Congressional opposition. Arthur F. Burns, the first of Eisenhower's chairmen,

receives high marks for his advice and Eisenhower comes off much better than many economists would have us believe. After that, of course came Kennedy, Walter Heller and a rising stature for the CEA that continued until the pressures of Vietnam brought it and President Johnson down. The late Arthur Okun once said that the prestige of the economist in Washington peaked in 1965. Perhaps, but as Norton relates, Herbert Stein, a CEA member who was Chairman Paul McCracken's Keyserling during the Nixon years, disagrees. On the other hand, Norton claims that then Secretary of Labor George P. Shultz ran White House economic policy.

Before closing with Reagan's first term, the author examines Jimmy Carter as the "ultimate outsider" and his CEA Chairman, Charles Schultze, as the "ultimate Washington insider." Schultze, a longtime civil servant in the British sense, was an orthodox neoclassical Keynesian. Depression economics can only slow inflation with a Depression; Carter had only enough political capital to endure a recession. Even Carter's recession was so badly timed that it helped to end his presidency.

Norton's book is political economy at its best, written with verve and wit. It blends economics, history and personalities in a way that engages even the wary reader. Through it all, he convinces us that the CEA has made a significant contribution to economic stability. If Eisenhower and Reagan had gone through with their threats to end the Council, the damage to economic policy making and public understanding would have been great.

*General equilibrium trade policy modeling*. Edited by T. N. SRINIVASAN AND JOHN WHALLEY. Cambridge, MA and London: MIT Press, 1986. Pp. vii, 360. \$40.00. ISBN 0-262-19245-4. JEL 87-0091

In its essentials, applied general equilibrium analysis involves the use of numerically speci-

fied Walrasian models to make comparisons between equilibria involving different policy regimes. It is a methodology increasingly used in the assessment of economic policy, particularly in the areas of taxation and international trade. As it is applied to trade policy, the methodology has obvious antecedents in the Meade-Johnson two-sector equilibrium trade models, but the increasing availability of computer resources and the development of appropriate solution techniques has freed researchers to pursue the large dimension models that are typified in this book. In addition to his own pioneering efforts, John Whalley has maintained a watching brief on the development of applied general equilibrium models and this present work is a logical and useful extension of his and John Shoven's (1984) previous survey of the field. He and T. N. Srinivasan have now produced something of a chronicle of a rite of passage of this particular modeling approach as it moves from youthful enthusiasm to a more mature, if still shaky self-confidence.

This volume represents the proceedings of a Conference on General Equilibrium Trade Policy Modeling held at Columbia University in April 1984 with the express purpose of requiring a small group of researchers, representing nine distinct general equilibrium trade models, to report on the effects of a 50 percent tariff cut on either a unilateral, bilateral or multilateral basis as appropriate to the scope of their own particular models. This exercise was seen as an instrument to bring areas of agreement and disagreement among models into focus and thereby identify the most promising avenues for future research. As participants also included economists identified with other approaches to trade policy analysis and other individuals closely associated with policy making, the conference afforded the opportunity of debating and gauging the policy relevance of the applied general equilibrium approach at its current stage of development.

The nine models discussed in this book differ markedly, not only in geographical scope, but also in terms of structural specification, data, levels of aggregation, calibration procedures and solution techniques. Not surprisingly, there is little agreement among the results, nor is it even easy to make meaningful comparisons among them. Generally, however, the welfare

implications are small, usually less than one percent, but exceptions are indicated in the papers by Richard Harris and by Wafik Grais, Jaime de Melo and Shujiro Urata. For Canada, Harris finds that a multilateral tariff cut of 50 per cent results in a 3.6 per cent increase in domestic welfare, a result he explains by the fact that his model incorporates scale and industrial organization considerations that can be exploited when trade liberalization affords a small economy access to larger markets. Grais, de Melo, and Urata obtain relatively high welfare implications for Turkey as trade liberalization eliminates rent-seeking activities associated with quotas.

All of the included models are subject to the general criticisms of the quantitative general equilibrium approach. These are legion, but the proceedings reflect an open and free flowing discussion of them. Perhaps the major difficulty is the matter of model preselection. Because structure must be imposed in the calibration procedure, there is no means of discriminating among alternative models and hence no procedure for resolving conflicting economic theories. Sensitivity analysis may offer a potential remedy, but only a few of the authors, Glenn Harrison in particular, have attempted to incorporate it. Srinivasan argues, however, that refutability of the models is unimportant since their advantages lie in their ability to provide insight into complex economic interdependencies rather than in their predictive ability.

Considerable attention is also given to the serious problem of obtaining appropriate trade elasticities. While these parameters are crucial to model results, most researchers continue to rely on estimates available in the literature, the reliability and appropriateness of which can be seriously questioned. With regard to the modeling of trade policy, most of the models incorporate only tariff measures, while it is clearly evident that nontariff barriers are the principal focus of current trade policy discussions. Similarly, none of the models deals adequately with adjustment costs, surely the most relevant aspect of policy changes for the policy maker.

Somewhat surprisingly, scant attention is given in the proceedings to the actual differ-

ences among the model results; indeed, the participants appear to have been quite reluctant to discuss them. Little seems to have been lost, however, as the conference and this book appear to have been successful in achieving the ultimate goals of examining the current state of applied general equilibrium modeling of trade policy and, out of that, establishing the agenda for future research efforts. Despite some pessimism about that future which one experiences in reading the book, it is difficult to deny the editors' conclusion that these modeling efforts are moving in sensible and appropriate directions in the attempt to bridge theory and its policy application.

It is also difficult to fault the editing of this book. The editors (with Deborah Fretz) provide a good introduction which includes tabular summaries of the model characteristics, their sources of data, and their major policy findings. They also appear to have enforced an unusual discipline on their writers in maintaining a consistency of structure across the individual contributions. Each paper includes a summary of the model characteristics, a discussion of the results obtained for the assigned tariff-cutting exercise, and, most importantly, an attempt to explain the intuition of the model and its results. However, if one part of the book stands out as a particularly valuable contribution, it is Randall Wigle's summary of a series of panel discussions on general equilibrium trade policy modeling that also formed part of the conference.

This is a well-crafted book which will be required reading for anyone interested in the modeling of trade policy. Given its intelligent and restrained assessment of the applicability of general equilibrium modeling to policy analysis, it also deserves to be read by the makers of policy and their advisors.

## 00 Quantitative Economic Methods and Data

210 ECONOMETRIC, STATISTICAL, AND MATHEMATICAL METHODS AND MODELS

*Longitudinal analysis of labor market data.* Edited by JAMES J. HECKMAN AND BURTON SINGER. Econometric Society Monographs series, no. 10. Cambridge, New York and Sydney: Cambridge University Press, 1985. Pp. xv, 410. \$49.50. ISBN 0-521-30453-9.

JEL 86-0450

This is a book with large quantities of useful material. For the practitioner it contains an encyclopedic overview of the techniques available for the treatment of several problems that arise repeatedly in the empirical analysis of longitudinal data sets. Though the examples are taken from data on individuals, similar problems arise in the analysis of firms, and the increasing availability of longitudinal firm-level data sets ought to make the essays of interest to a wide variety of empirical researchers. For the more theoretically minded econometrician, it provides, in addition to new results, some thoughtful discussion on what are the important open questions, and how we ought to look for solutions to them. The importance of a question and the appeal of a solution are defined in terms of their usefulness in analyzing issues that arise in the social sciences—an eminently reasonable criterion.

The book is divided into three sections (labeled Econometric Studies, Statistical Studies, and Sociometric Studies, respectively). Three of the four essays in the introductory section consider the statistical analysis of relatively simple standardized models (such as the linear stimulus-response model, and the proportional hazard model) in the presence of unobservables and/or selection mechanisms which confound the relationships of interest. The advantages of standardization and simplicity are such that the models discussed in these essays provide a first (and often the only) cut at longitudinal data analysis of most empirical issues. Further, in economic applications, the confounding effects of unobservables and selection mechanisms seem to be both pervasive and, at least under only mild regularity conditions, difficult to account for. Two of the three essays in the statistical studies provide more detail on related

issues. The two "deviant" papers (there is one in each section) are more directly concerned with the interplay between economic theory and the structure of the econometric model that might be fit to the data. Indeed, the question of the extent to which economic theory ought to be used to structure econometric analysis threads its way through most of the essays, and I come back to it below. The Sociometric Studies section contains two empirical studies which illustrate how some of the issues discussed in the earlier essays arise. These studies also serve to remind us that increases in the availability and quality of data could do as much to increase our understanding of the issues at hand as could advances in econometric methodology. I now proceed to outline the themes of the articles in the Econometric Studies section.

Gary Chamberlain's paper, "Heterogeneity, Omitted Variable Bias, and Duration Dependence," begins by considering the problem of time invariant unobservables in the linear stimulus-response model with continuously observed responses. Since the effect of the unobservable on the observable response is additively separable in these models, he can, under mild regularity conditions, base identification and testing on projection arguments—at least if the process generating the  $x$ 's is strictly exogenous of the disturbance process (each year's disturbance is uncorrelated with past, present, and future  $x$ 's). There are many cases in which strict exogeneity is unreasonable and then, as the article shows, things get more difficult, but are not always hopeless. A similar analysis applies to nonlinear models provided the effect of the unobserved component is additively separable. In models for discrete data the effect of the unobserved component is buried inside a nonlinear probability statement, and currently used techniques require more explicit distributional assumptions for identification. For some disturbance distributions an assumption on their conditional distribution is enough, but for most an assumption on the conditional distribution of the unobservable is needed also (given both, and some mild regularity conditions, only a computation problem remains and this is an area in which significant progress has been made since Chamberlain's article). The article goes on to discuss the relationships between serial correlation, state de-

pendence, and the sampling interval between observations.

James Heckman's and Burton Singer's "Social Science Duration Analysis" begins with an accessible introduction to the statistical analysis of duration data with emphasis on the restrictions implicit in the proportional hazard specification (the hazard function gives the probability of exit from the state per unit of time conditional on survival until that time, and in the proportional hazard model differences among individuals do not affect the curvature of the log hazard function, only its origin). The article then focuses on the bias induced by uncontrolled for, or incorrectly controlled for, heterogeneity (differences across individuals) in the proportional hazard model (uncontrolled for heterogeneity induces a bias towards negative duration dependence, or a falling hazard over time). The article provides a summary and extension of recent work (some of it by the authors themselves) on obtaining consistent estimates (or test statistics) for the form of time-dependence structure of the hazard function when there is heterogeneity of an unknown form. Their strategy is to allow for unobserved components whose distribution, though independent of the observed  $x$ 's, need satisfy, in addition, only mild regularity conditions. Sections on using information from samples where the start and finish date of the sample does not coincide with the start and finish date of spells, and on multistate multispell models follow.

James Heckman and Richard Robb in "Alternative Methods for Evaluating the Impact of Interventions" examine the impact of interventions in the presence of endogenous selection rules by agents (the motivating example is estimating the impact of training on earnings when there is endogenous selection into the training program). This paper gives a play-by-play of the problems researchers who are attempting to analyze interventions in an economic setting are likely to face, and ought, therefore, to be read before engaging in such an endeavor. For each such problem (heterogeneous responses and training by agents, contamination and measurement error in training status and other observables, choice-based and other nonrandom sampling schemes, time inhomogeneity of the environment), the authors consider assumptions which lead to identification with both dif-

ferent types of data (cross-section, repeated cross-section, and longitudinal) and different observables available for the analysis. Several conclusions emerge, among them that the assumptions required for identifying the mean training effect from longitudinal data are similar to those required to identify it from repeated cross-sections. They also note that if there is a distribution of training effects, the coefficient estimated is the mean effect of training on those who were trained (an effect whose value will change with differences in the selection procedure).

The papers discussed thus far use economic theory more to motivate a class of problems that arise in obtaining estimates for a standardized structural form than to derive the estimating equations from lower level assumptions on the environment and behavior. This strategy has the advantage of providing a basis for comparisons (among alternative econometric and theoretical arguments, as well as between different data sets), and therefore provides a useful, perhaps necessary, first step in any analysis. There is some trepidation however, about our ability to push structural modeling further than this. Partly this is a result of the fact that, for many problems, there is no widespread agreement on the appropriate theoretical structure, and the list of possibilities has simply grown too large to nest them all into one framework. Moreover, theoretical arguments do not provide detailed information on functional forms (though they may provide conditions which a consistent structure must satisfy), and it would simply be too difficult (if not impossible) to provide estimates for the more complicated structural models without appending to them somewhat arbitrary functional form assumptions. On the other hand detailed theoretical modeling has the advantage of specifying how the interrelationships between different pieces of information can be brought to bear on the problem, and, in addition, provides a clear, internally consistent, interpretation of the parameters being estimated. Thomas MaCurdy's chapter, "Interpreting Empirical Models of Labor Supply in an Intertemporal Framework with Uncertainty," moves a step towards more detailed structural modeling. There is some general agreement on the appropriateness of the life-cycle model for labor supply and MaCurdy fills

in more detailed assumptions where necessary (the form of the utility function, the sense in which the budget constraint must hold, etc.). As a step towards accounting for the characteristics of the data, he complicates an already complicated stochastic control model by allowing for unobservable individual specific heterogeneity, but then eschews obtaining a complete solution for the model in favor of an approximation on the stochastic process generating the marginal utility of wealth. This allows him to form an estimating equation which interprets estimates of the intertemporal substitution elasticity from a variety of different types of data. There has been more work on structural econometric modeling of dynamic decisions since MacCurdy's paper, but we are still very much at a stage where results depend on precise functional form assumptions, and where many of the disturbance processes that we think are important cannot be incorporated.

A different attack on this problem is provided in an innovative paper by Halina Frydman and Burton Singer, "Assessing Qualitative Features of Longitudinal Data." They are able to use De Finetti's discussion of exchangeability and partial exchangeability to construct simple tests for the consistency of data with a broad class of discrete choice models—a class that is not sensitive to the functional form of the disturbance and unobservable distributions. They also provide a distribution free test for compatibility of first passage time data with a class of stochastic differential equations that can be generated from a continuous time specification of utility dynamics. This paper pushes us away from functional form dependence in the interface between economic theory and certain types of structural econometric models. There is still, however, a large gap between obtaining test statistics for the relevance of a class of models, and obtaining meaningful estimates for the responses of interest.

I have only covered the articles in the *Econometric Studies* section, and just the central points in them. This is due solely to a combination of space limitations, and my perception of the *Journal's* readership. Actually this book ought to be a welcome addition to the libraries of most social scientists and applied statisticians.

ARIEL PAKES

## 220 ECONOMIC AND SOCIAL STATISTICAL DATA AND ANALYSIS

*Comparative national balance sheets: A study of twenty countries, 1688–1978.* By RAYMOND W. GOLDSMITH. Chicago and London: University of Chicago Press, 1985. Pp. xvii, 353. ISBN 0-226-30153-2. JEL 87-0108

While national income and product account estimates are regularly compiled in most countries and are easily accessible, this is not true of national balance sheet statements. This book presents and analyzes national balance sheets for twenty countries for selected years since 1950, and extends balance sheets back into the nineteenth century for ten countries.

The book contains four chapters and three appendices. Chapter 1 summarizes the main analytic points observed in the study of the balance sheets, attempts to extend the known balance sheets to a planetary basis, and studies the growth of national assets, asset/production ratios, and the financial interrelations ratio—the ratio of financial to tangible assets. Five principal results are stated: (1) In the late 1970s tangible assets accounted for three-fifths of planetary assets and financial assets accounted for two-fifths; (2) among developed market economies, there was a sharp reduction over the past century in the share of farm land and livestock in the national wealth, a rise in the share of financial assets in total assets, and an increase in the share of financial institutions in financial assets; (3) the creation of a modern financial superstructure was generally accomplished at a fairly early stage of a country's economic development; (4) economic development was accompanied by a more than proportionate expansion of the financial superstructure in the early and intermediate stages, and by a parallel expansion of the size of the infrastructure and the financial superstructure in mature modern economies; and (5) financial institutions are now either holders or issuers of one-half or more of financial instruments in market economies.

Chapter 2 discusses the conceptual problems involved in creating national balance sheets. The conceptual problems discussed are: The scope of the balance sheets in terms of assets; the classification of assets and liabilities; sectorization; valuation, and selection of benchmark dates.

balance sheets for the twenty countries. For tangible assets the discussion is organized around the distribution of tangible assets among land, residential structures, nonresidential structures and equipment, inventories, livestock, and consumer durables. For financial assets, the discussion is organized around the share of the various types of financial assets in total financial assets.

Chapter 4 focuses on the use of sectorized balance sheets for six countries. In the first part of this chapter, assets, liabilities, and net worth are generally analyzed in terms of the share of each sector in the national total of each type of asset, liability or net worth. In the second section the balance sheet structure of each sector is analyzed in terms of similarities or differences between countries.

Appendix A shows the national balance sheet for each of the twenty countries with percentage shares of national assets; the total values of national assets are also shown denominated in the country's currency so one can record the balance sheet in monetary form if desired. Appendix A also highlights secular developments in each country's balance sheet and gives either detailed notes on the derivation of the estimates or gives references to other works by Professor Goldsmith where the detailed derivation for the balance sheets of some of the countries may be found.

Appendix B gives the sectoral balance sheets for six countries. Appendix C discusses briefly some statistical difficulties encountered in estimating some of the balance sheet components.

This book is a pioneering venture. Only three countries have published official national and sectoral balance sheets for a few recent years. Professor Goldsmith compiled the balance sheets for the seventeen other countries and extended as many of them as he could back into the nineteenth century.

I find it disheartening that there should be a need for a pioneering venture of this type so late in the day. The fact that national and sectoral balance sheets are not part of the regular statistical output of the economically developed countries needs to be explained, but the author does not address this.

Professor Goldsmith's work over the past 40 years shows that it is not impossible to derive national and sectoral balance sheets. The problem is that the profession has not made the

case that an addition of balance sheets to our statistical program would assist economic policy makers in ways that would justify the costs. If we were seriously to pursue the goal of timely annual balance sheets, the costs would require substantial additions to our statistical programs in terms of data collection, and analyses.

To test the usefulness of this information, I reviewed the balance sheet of the United States in 1929 to see if anything was so seriously out of line with prior experience that an analyst might have concluded that the debacle of the Great Depression was possible (Table A-22). The only asset whose share in total national assets was out of line was corporate stock, which at 19.4 percent of national assets was far above its share in earlier years or in other countries. Knowledge that stock market values had outstripped the value of tangible assets might have warned the policy makers to limit the speculative borrowing that was fueling the stock market.

This book is a useful addition to our knowledge. It shows balance sheets can be compiled. Further it shows that balance sheets can be useful in pinpointing speculative excesses—a role that can only be enhanced by having annual balance sheets with detailed sectors available. Professor Goldsmith deserves our thanks for this. Now it is up to the profession to see that the balance sheets are added to our regular statistical program.

### 300 Domestic Monetary and Fiscal Theory and Institutions

#### 310 DOMESTIC MONETARY AND FINANCIAL THEORY AND INSTITUTIONS

*The industrial organization of futures markets.*

Edited by RONALD W. ANDERSON. Lexington, MA and Toronto: Heath, Lexington Books, 1984. Pp. vii, 312. \$28.50. ISBN 0-689-06836-5. JEL 84-1069

In the last decade, the popularity of futures markets has soared as contracts in new product areas have been introduced. Accompanying this emerging importance has been a significant increase in attention from the media, contract users, academics and regulators. While much

of the literature published has been of the "how-to-use-futures" nature, this volume is not; it presents several academic economists' contributions toward a theoretical framework for analyzing futures market performance and regulation. Although this book would prove interesting to anyone concerned with applications of industrial organization topics, its major thrust is further study of futures markets. The nine chapters consist of versions of papers and comments presented at a November 1982 conference sponsored by the Center for the Study of Futures Markets at the Graduate School of Business, Columbia University.

When contemplating a foray into futures trading (or the trading of any financial instrument, for that matter), one might first ask whether the market is truly competitive. We might be tempted to answer yes as Ronald W. Anderson and Mahadevan Sundareshan note that, "the fact that anyone may buy or sell futures contracts for homogeneous goods in centralized markets at publicly quoted prices suggests that these markets come close to fulfilling the standard criteria for perfect markets" (p. 75). However, necessary consideration of the arbitrage connections between cash and futures markets reveal market characteristics that preclude a quick resolution of the issue. For example, futures contracts for crude oil, cocoa, coffee, and copper illustrate cash markets that are characterized by dominant producers. In addition, one might argue that institutional investors and securities dealers have better information than the general public concerning the order flow for financial instruments—an advantage which could prove useful in trading contracts based on Treasury bonds or the Standard and Poors 500 stock index. Therefore, assessing the performance of futures markets warrants the use of models that incorporate agents with market power.

All chapters (except 1 and 7) develop models of futures trading based on market structures with various imperfections. They differ mainly in their assumptions regarding the characteristics of market participants, the information possessed by market participants, risk preferences, timing of market clearings, and alternative hedging vehicles (or alternative markets in which to exercise market power). David M. G. Newbery examines futures trading for a non-storable commodity produced both by a risk-

neutral dominant firm and many small, risk-averse competitors. The geometric restatement of the model by Lawrence J. White is extremely clear and significantly improves our understanding of the interesting results. Louis Philips' comment extends the discussion to storable goods. In Chapter 3, Anderson and Sundareshan return to the case of a futures market for a perishable commodity, but limit production to a monopolist's output level. In Simon Beninga's chapter, hedgers have an informational advantage—knowledge of their futures commitments. They use this market power to influence futures prices by sending misleading signals to speculators. The source of imperfect competition in Albert S. Kyle's model is a futures market participant (the squeezer) who observes the quantity of contracts offered by hedgers *before* choosing his own trading position. Again, it is a restatement of the model in the comment by Stephen W. Salant, that is most readable. In Chapter 6, by Graciela Chichilnisky, all agents are aware that they have private information and thus recognize that they may have some market power to influence prices. This scenario is analyzed in a game theoretic context. Garth Saloner focuses on the monopoly power of the limited membership of futures exchanges. In Chapter 9, the most abstract of the volume, Robert M. Townsend examines general equilibrium models with asymmetric information and limited communication, and argues the role of government in implementing or coordinating trading.

Our *a priori* notion is that market imperfections will affect the economic functioning of the futures market in risk shifting (insurance), information and price discovery, providing liquidity, and/or reducing transactions costs. The book supports our intuition. The exercise of market power by Newbery's dominant producer (Ch. 2) reduces the volume of futures contracts traded and increases the spread between the futures price and the expected future spot price (compared with competitive behavior). In Kyle's model, hedging becomes more costly when squeezes can occur. In response, less hedging is done, more risk is borne, and consequently, less output is produced. The exchange members in Saloner's model charge commissions that capture the entire risk premium; consequently, "if the farmers' aggregate supply

function is increasing in price, a suboptimal quantity of the output will be provided in equilibrium" (p. 272).

Naturally, then, the book frequently turns to discussions of exchange innovations and/or government regulations designed to prevent the use of market power. Kyle examines limits on the size of positions held by traders, multiple deliverable goods, premiums or discounts for nonstandard delivery, and cash settlement of contracts; Newbery, Benninga, and Chichilnisky mention requiring full disclosure of actions by market participants; and Anderson and Sundaresan ask whether futures trading should even be authorized for commodities produced under imperfect competition. These topics suggest fruitful avenues for empirical investigation, of which there is none in this volume.

One of the features of futures market organization often cited in this volume as contributing to the ability to exercise market power, is the anonymity afforded by the clearing association. Besides facilitating trade among strangers, the other major role of clearing houses is ensuring the financial integrity of futures markets. In the only practical chapter, Franklin R. Edwards carefully describes and analyzes the function, organization, regulation, and mechanics of the not-often-understood clearing process. This excellent paper emphasizes the importance of this institution and examines some unresolved issues relating to the size and setting of margins, and the costs and benefits of consolidating clearing associations.

A recurring concern throughout the book is the possibility of and prevention of futures market "manipulation." However, as Anderson notes in his Chapter 1 survey, "neither common usage nor specific legislation makes clear what exactly is involved in a futures market manipulation" (p. 9). Thus it is not surprising that authors use the term to describe far different behavior. Thus Anderson's extensive review of this topic in Chapter 1 is a valuable contribution as is his overall perspective of this "new" area of research.

DEBORAH G. BLACK

Hunter College, CUNY

*United States interest rates and the interest rate dilemma for the developing world.* By J. Pierre V. Benoit. Westport, CT and London: Greenwood Press, Quorum Books, 1986. Pp. xviii, 230. \$39.95. ISBN 0-89830-131-2. JEL 86-0739

The debate over interest rate policy in developing countries in the postwar period has generated much more heat than light. The same is true of the argument over the effect of the U.S. federal budget deficit on real rates of interest in world markets. Jean-Pierre Benoit, formerly a high official in the Haitian Ministry of Finance and now chief of the Fiscal and Financial Branch of the United Nations Secretariat, recounts the story of rising interest rates, first nominal then real, in the United States, describes their impact on developing countries, and considers appropriate interest rate policy for such countries. The implicit theoretical framework is neoclassical.

Benoit's book contains five loosely related essays. Chapter 1 starts with a summary of the historical debate over the effectiveness of monetary policy. It then describes the secular postwar rise in U.S. interest rates and comments on the tax treatment of interest. Benoit suggests that the tax deductibility of interest payments has reduced personal saving in the United States, but he provides no comparative evidence. He also describes the various tax measures designed to encourage foreign capital inflows to help finance the federal government deficit.

The final section of Chapter 1 turns to the interest rate dilemma facing developing countries. Benoit sees the dilemma as the choice between "a policy of artificially low interest rates that stimulates investment in unsound projects and the choice of capital-intensive technologies" and "allowing interest rates to be determined essentially by market forces that might result in interest rates rising so high that they would constrain productive investment" (p. 26). There is no reference to the recent experiences of Argentina, Chile, Turkey and Uruguay with excessively high real rates.

Chapter 2 reviews attitudes towards interest since antiquity. King Hammurabi of Sumer set maximum interest rates in his 1800 B.C. Code of 20 percent for silver and 33.3 percent for barley loans. The Code supported a wide variety of collateral, including wives, concubines and children (to be returned in good condition after three years use). Chapter 2 contains lengthy descriptions of attitudes towards charging interest in Judaism and Christianity. The bulk of the chapter, however, is devoted to Islamic views on interest. The historical introduction paves the way to a description of the current wave of Islamization of banking in most Islamic countries. Benoît attempts to explain the new interest-free banking arrangements. He touches on a few problems such as illiquidity due to the inability of Islamic banks to hold short-term treasury bills or to borrow on the interbank money market. Those interested in this particular topic might do better to read *Islamic Banking* by Zubair Iqbal and Abbas Mirakhor which contains a comprehensive bibliography. Documentation is not one of Benoît's strengths.

Chapter 3 turns to foreign debt. Benoît's historical excursions are really the best parts of this book:

Of the thirteen Greek states which borrowed from the temple of Apollo at Delos in the fourth century B.C., eleven defaulted and four-fifths of the loans were never repaid. Thereafter, the temple became somewhat disinclined to lend to sovereign borrowers, opting instead to make loans to individuals who could pledge land as collateral. (p. 93)

All too quickly this chapter reaches today's foreign debt problems. First Benoît describes the strategy of the creditor banks. Since they can no longer rely on gunboat diplomacy, their strategy is to push for a government bailout. The debtors' strategy is to persuade the countries of their creditor banks that they must share responsibility for the problem. Various meetings at which debtor countries have thrashed out their position are described in detail. Finally Benoît describes the creditor countries' attitude. Apart from the United States, the OECD countries blame the U.S. federal budget deficit and urge the United States to reduce it. Benoît sees the United States as inflexible but gives virtually no space to the Baker initiative.

The upshot of the debate appears to be one in which the developing countries seek a global solution while the OECD countries advocate a case-by-case approach.

Although Benoît favors a global solution to the debt problem, he is not soft on the developing countries. The last part of Chapter 3 proposes increased tax effort, more effective domestic resource mobilization, the eradication of corruption, and regional cooperation as the way out of the debt imbroglio.

Chapters 4 and 5 return to interest rate policies. Benoît distinguishes three approaches: the administered interest rate system, the modified administered interest rate system, and the market interest rate system. The administered interest rate system is characterized by low and inflexible institutional interest rates that frequently turn negative in real terms. Under the modified administered interest rate system, interest rates are still determined by administrative decision but are adjusted frequently in the light of market conditions. Since the market interest rate system is rarely encountered, much of this section is devoted to describing recent deregulation in Britain and the United States.

In the final chapter, Benoît equates the just interest rate with the market interest rate determined under perfect competition. He claims that this produces a real interest rate in industrial countries of 2 to 5 percent. Since the preconditions for such interest rate determination are absent in developing countries, he advocates the modified administered interest rate system. It should set real interest rates for short-term financial instruments in developing countries in the 2 to 5 percent range. Given capital scarcity in developing countries, however, real rates should rise to 15 to 20 percent on longer-term instruments. Indexation is the obvious solution for maintaining these appropriate real rates in the face of volatile inflation.

This is an old-fashioned book containing virtually no coverage of theoretical issues and very little empirical evidence to support the author's assertions. The scant source references is another troubling feature. Nevertheless, I enjoyed Benoît's historical vignettes and common-sense approach to policy issues. This well-written book should appeal to those wanting a well-balanced review of the debates over inter-

est rate policies and foreign debt in developing countries.

MAXWELL J. FRY

*University of California, Irvine*

#### REFERENCE

IQBAL, ZUBAIR AND ABBAS, MIRAKHOR. *Islamic banking*. Washington, DC: International Monetary Fund, Occasional Paper 49, Mar. 1987.

*Financial crises and the world banking system.*

Edited by FORREST CAPIE AND GEOFFREY E. WOOD. New York: St. Martin's Press. 1986. Pp. x, 270. \$29.95. ISBN 0-312-28946-4

JEL 86-1084

The volume at hand contains six papers and associated comments from a conference at the City University, London. I would like to report that the papers add up to a serious contribution, but I cannot. The contributions are seriously flawed. A common assumption is that financial crises can be understood without explicitly considering the financial structure and the cash flows (wages, profits, taxes and foreign exchange earnings) that support the payment commitments of the financial structure: essential capitalist relations are not modeled. Thus the money supply appears as a variable in these papers, but the commitments that are undertaken as money is created are ignored.

Anna Schwartz' paper "Real and Pseudo-financial Crises" quite predictably assumes that monetarism is valid. Her aim is to show that "The hugaboo of financial crisis has been created to divert attention from the true remedies that the present financial situation demands" (p. 13). Real and pseudo-financial crises are distinguished: real financial crisis occurred because "no institutional framework was immediately available to deal with the surge of demand for high-powered money by the public and the banks" (p. 18); therefore "there is a well-understood solution to the problem: assure that deposits can be converted at will into currency whatever the difficulties the banks encounter" (p. 28). It follows that none of the episodes of the past twenty years qualify as true or real financial crises.

One of the precepts of monetarism is that Smith's invisible hand proposition is valid. But in Schwartz' account recent potential crises were transformed into pseudo crises by the visi-

ble hands of central banks and deposit insurers: appropriate intervention is stability enhancing.

"The Avoidance of Catastrophe: Two Nineteenth-century Banking Crises" by Roy A. Batchelor, introduces formal models of catastrophe and reactions to uncertain information in an endeavor to throw light on two nineteenth century episodes: the collapse of Overend, Gurney & Co. Ltd. and the liquidation of Baring Bros. A catastrophe theory approach to manias or bubbles leads naturally to an analysis that emphasizes cash flows, liability structures and the role of externally financed demand in determining income and employment. The ability to validate business debt by floating new debt has to be contrasted with the validation of debt by profit flows. Batchelor has a catastrophe occur when units systemically have to sell assets to obtain cash, but why this occurs only sometimes is not made clear. The question about why Gurneys was sunk and Barings was rescued is answered by noting that it was the "difference in political and personal relations between these institutions and the officials of the Bank of England which determined who should sink and who should swim" (p. 71). This conclusion does not rest upon the formal mathematical argument.

Teresa Seaborne's "The Summer of 1914," and Forest Capie, Terence Mills and Geoffrey Word's, "What Happened in 1931" examine two crises. The war crisis of 1914 was clearly not part of a normal business cycle. Cash flows were disrupted by hostilities and quite rationally the outbreak of the war made liquidity more valuable. The international flow of loans from Britain to roll over debtors was halted; as a result loans could not be repaid.

The suspension of specie payments, providing for subsidiary currency and measures to make institutions which were not receiving funds from enemy debtors "whole" enough to function resolved the crisis. The way it was resolved is not linked to later developments such as deposit insurance.

In 1931 Britain left the gold standard. Capie, Mills and Wood conclude that in 1931 "the world saw the consequences of central bankers not understanding central banking" (p. 144). I would go a bit further. Before central bankers can understand central banking they need to understand the economy. Behind the absence

of successful intervention in the 1930s lay a lack of understanding of the relation between government intervention to sustain profit flows and central bank intervention to contain asset price declines and shortages of liquidity. The same lack of understanding of the links between income production and the financial structure is still prevalent.

Hugh Rockoff's "Walter Bagehot and the Theory of Central Banking" is a model exercise in the history of thought. Bagehot is remembered for the prescription for central bank behavior in times of crisis "lend freely at high interest rates" (p. 160), but he also argued that it is necessary for a central bank to "protect the reserve when the market is merely apprehensive" (p. 161).

Rockoff makes it clear that a central bank has to be ready to "shift gears." It is the task of monetary theorists to instruct central bankers so that they know when to shift. This means that theory must identify indicators of the crisis-proneness of an economy. Neither Rockoff nor any of the other contributors tell us how this identification is to be made.

In "Financial Crises, Banking Crises, Stock Market Crashes and the Money Supply: Some Evidence 1870-1933," Michael D. Bordo identifies two main approaches to understanding financial crisis. The monetarist approach of Friedman, Schwartz and Cagan and an alternative real cycle approach identified with Fischer-Minsky-Kindleberger. The latter

regards financial crisis as an essential part of the upper turning point of the business cycle—as a necessary consequence of the previous boom. The modern proponents, Minsky and Kindleberger, basically extend the views Irving Fisher expressed in *Booms and Depressions* (1932). (p. 197)

Certainly Minsky, and I believe Kindleberger, would argue that they are integrating insights from Fisher and from Keynes' *General Theory*. In my understanding the Minsky-Kindleberger theory combines an investment theory of business cycles, a financial theory of investments, and the explicit modeling of financial structures as payment commitments. Wages, profits, rents, taxes and the foreign balance are the sources of funds to fulfill these commitments, and these "sources" in turn depend upon the extent of new debt or other external financing. It follows that external financing

the explanatory performance of a Friedman-Schwartz and a Kindleberger-Minsky model by analyzing purely monetary relations is inept: the two models require quite different data bases for testing.

To conclude, the papers are interesting for the topics they raise rather than for their analytical frameworks or their conclusions.

*Futures markets: Their economic role.* Edited by ANNE E. PECK. AEI Studies in Government Regulation. Washington, DC: American Enterprise Institute for Public Policy Research, 1985. Pp. xiii, 325. \$21.95. ISBN 0-8447-3592-2. JEL 86-0754

*Futures markets: Regulatory issues.* Edited by ANNE E. PECK. AEI Studies in Government Regulation. Washington, DC: American Enterprise Institute for Public Policy Research, 1985. Pp. xiii, 376. \$24.95. ISBN 0-8447-3593-0. JEL 86-0753

Since their start more than one hundred years ago, organized futures markets have frequently been misunderstood and denigrated. For example, in the 1890s they came within a hairsbreadth of being outlawed. They alone must justify beforehand that a new instrument benefits the economy rather than relying on the actual desire for trading to prove their case. This scrutiny extends to the Federal regulatory agency, the Commodity Futures Trading Commission, that oversees futures markets. Part of the legislation renewing the CFTC in 1982 authorized studies on the purpose of futures markets, especially the emerging financial futures, and their interaction with existing securities markets. These two volumes, with essays by many of the leading scholars of futures and securities markets, are meant to complement the government's studies.

These companion volumes comprise thirteen self-contained essays. For the most part the essays review the literature, such as that on live-stock futures. Written with the nonspecialist in mind, most emphasize verbal descriptions. There is a minimum of formal modeling or statistics.

Among the reviews of the literature, the ones by Anne Peck on traditional agricultural futures markets and by William Silber on financial futures markets stand out. Peck's survey of the

presents, among other subjects, how futures markets guide intertemporal allocations and how actual holders of inventory seem to follow well behaved supply-of-storage curves. Silber argues that the main advantage of financial futures is their extremely low transactions costs, even when measured against other security markets. According to his perspective, a manager of a pension fund can reduce quickly and inexpensively his proportion in equities by selling stock-index futures contracts rather than the myriad different issues in the fund's portfolio. Silber's essay would make an excellent introduction to a segment on financial futures in an advanced undergraduate course on financial markets or on money and banking.

Two essays will interest a specialist in futures markets for their new empirical evidence on some old issues. William Tomek studies whether the exchanges have set initial margin (a good-faith deposit) high enough to ensure the integrity of contracts. He finds that from 1970 to 1982 the exchanges were, if anything, too conservative in setting margin, hardly evidence that the government should supersede them. He also finds only weak evidence that changes in the level of margin influence either the volume of trading or price volatility, and what evidence there is could just as well be interpreted as the changes in price volatility determining an exchange's initial margin, as they should. Thus, Tomek concludes that even if it is desirable for the government to dampen speculation, its control of initial margin would provide far too crude an instrument.

Dennis Draper offers a portrait of nonprofessional traders, based on surveys conducted by *Barron's* and the Chicago Board of Trade. Previous research based on the patterns in the accounts at single brokerage firms had suggested that the typical small trader was undercapitalized, uninformed, and remained in the market only until he had been shorn by the professionals. According to the two new surveys, the small traders typically hold considerable other assets, are well educated, and remain in the market for extended periods, often switching brokerage houses in the process. They appear to be well aware of the risks. Draper concludes that this picture indicates not so much that protection of small investors is unnecessary, but that recent efforts, required by the government of all commission houses, at screening customers and

disclosing the risks associated with futures trading have worked as intended.

The one essay adding to formal theory is by Jerome Stein on financial futures' effect on capital formation. Stein models how a risk-averse dealer in bonds or a risk-averse originator of mortgages will change its bid-ask spread or origination fee with the possibility of hedging on the futures market. He is in effect arguing that the primary advantage of financial futures is an expansion of the possible portfolios available to such agents. Thus, Stein has a perspective opposite from Silber's. That two scholars can make such different, yet coherent and plausible, cases for futures markets makes one suspicious of any regulation of the markets implicitly depending on a particular view of their function.

Many of the essays touch on regulatory issues, including Allen Paul's study of settlement of contracts by cash rather than a physical commodity. Yet the two volumes do not divide clearly, as their titles imply; they need to be bought as a pair. For example, Charles Seeger's account of recent government concern about financial futures, including the battles for turf between the CFTC and the SEC, is in the second volume, while reflections by Philip Johnson, the former chairman of the CFTC, on those battles is in the first volume. For his part, Johnson offers a new reason for the limits of regulation. He argues that well meaning people, especially those with only a superficial understanding of the markets and regulatory system, assign impossible tasks to the regulators, such as requiring the CFTC to police fly-by-night "boiler-rooms" selling commodities to the gullible and greedy. Tarnished by the inevitable failure, the regulatory agency is unable to accomplish those tasks for which it is suited.

### 320 FISCAL THEORY AND POLICY; PUBLIC FINANCE

*Economic choices*, 1987. By HENRY J. AARON ET AL. Washington, DC: Brookings Institution, 1986. Pp xii, 126. \$22.95, cloth; \$8.95, paper. ISBN 0-8157-1040-2. JEL 86-1096

Six authors, among them Joseph Pechman, Alice Rivlin, and Charles Schultze, all with high-level experience in government, take collective responsibility for this volume. It follows

a similar Brookings book, *Economic Choices*, 1984 edited by Rivlin, that was published during the election campaign. The present work contains four essays pulled together by an overview chapter. They lay out major options for macroeconomic policy, deficit reduction, tax structure, and the budget process and make recommendations in these areas. Since the work is patently more one of advocacy than analysis, there is no point to dwell on any of its biases. It is an unavoidable professional hazard of those who dispense policy advice that they must be convinced of their ability to point the nation in the right direction. Hence I will describe, but not take issue with that advice and then comment on the manner and coherence with which the advocacy is conducted.

The budgetary choice favored by the authors is to achieve the Gramm-Rudman-Hollings (GRH) deficit reduction targets through fiscal 1989 with a different mix of fiscal measures than the automatic spending cuts mandated under that law when all else fails. The book, written well before passage in October of the Tax Reform Act of 1986, recommends instead a mixture of tax increases and widespread, but unequal spending cuts from a hypothetical baseline level. That level is estimated with two major adjustments (p. 54) from projections published by the Congressional Budget Office in February 1986. For fiscal 1989, a baseline deficit of \$187 is contained in the five-year projections. To reduce this to the GRH figure of \$72 billion, the authors recommend that \$50 billion more in taxes, produced by raising income tax rates above presumed post-reform levels, be matched by about \$30 billion in defense cuts and a net reduction of \$20 billion in civilian spending. The remaining \$15 billion would come from less interest being owned on a smaller national debt. Apart from arguing for this "balanced" way of curbing the deficit, the study recommends procedural reforms designed to make budgeting more comprehensible and the process less time consuming.

All options, whether proposed from Brookings or by others, are spelled out fully and fairly, but then the process of persuasion begins. The authors tend to rest much of their case on propositions treated as self-evident and on values represented as widely shared. Having laid claim to representing the reasonable con-

sensus position—one containing elements "seen even by many conservatives" (p. 61)—they appeal to its authority to judge other positions. Some readers will resent being led in this way; but generally this manner of advocacy is effective, allowing the volume to succeed on its own terms.

Before the book proceeds carefully to consider the tax and spending measures by which the deficit is to be reduced from the baseline, it presents macroeconomic analysis described as "inexorably" (p. 46) pointing to the need for deficit reduction. This provides an opportunity to assess the coherence of advocacy. The authors believe that, under present circumstances, there is a large degree of offset between changes in national saving and the external balance. Thus reducing saving increases the current account deficit, leaving little effect on economic activity. An extreme form of this result is familiar from the Mundell-Fleming analysis according to which fiscal stimulus is ineffective in a small country under flexible exchange rates with international equality of interest rates. Applied in reverse it means that moves toward lower fiscal deficits are not likely to jeopardize continued economic recovery from the demand side as they raise long-term capacity for growth from the supply side. Instead, curbing fiscal deficits and adding to national saving, by reducing interest rates and the exchange value of the dollar, would raise both domestic investment and net exports.

Should fiscal deficits continue unchecked, the dollar would also come down as foreigners become less eager to acquire dollar claims (p. 25). However, the induced rise in net exports would then have to be largely at the expense of domestic investment. Real interest rates and expected inflation rates would rise in a process of crowding out.

This analysis, which involves several scenarios in which an unidentified measure of the exchange value of the dollar is projected to decline by 15 percent during each year from 1986 through 1988, is uninhibited by J-curve effects and considerations of market efficiency. It contains one or two incompletely explained and possibly misleading measures such as the U.S. current account balance at high employment. Nevertheless, the reasoning is probably adequate for deducing prospects under different

fiscal scenarios, provided flow rates and prices do not change abruptly.

Overall the book represents a distinguished entry in the struggle to reassert fiscal responsibility through well-supported, itemized decisions. Irrespective of whether one favors this particular champion, it is a joy to see one fighting so well and fair for deficit reduction and selective measures to achieve it. However, because some targets have moved or perished, before the 1988 election a new volume on economic choices will be needed to uphold the quality of a debate that has few other reliable supports. As the year-old volume suggests (p. 111), things are increasingly done in government that none of the participants professes to want.

GEORGE M. VON FURSTENBERG  
*Indiana University*

*How real is the federal deficit?* By ROBERT EISNER. New York: Macmillan, Free Press; London: Collier Macmillan, 1986. Pp. xvi, 240. \$17.95. ISBN 0-02-809430-5.

JEL 87-0140

According to recent opinion polls, the public considers the federal deficit to be a grave national problem. Consequently, the deficit, which has always been a political issue to some extent, is now a hot one. Politicians seem to agree that deficits are bad, that the current one is much too large, and that it must be reduced. They disagree only on who is to blame, on whether taxes should be raised or spending cut, and if spending is to be cut, what categories should be targeted.

Robert Eisner argues that deficits should not now be a major political issue. His argument has two parts. First, when the federal deficit is correctly measured, it has not actually been large. Indeed, until recently, the budget has usually been in surplus. Second, when the economy is operating with slack as it is now, deficits are desirable because they raise aggregate demand, thereby increasing output. Therefore, present fiscal policy is basically sound. The federal budget deficit should be reduced only as the economy approaches full employment some years hence.

The official measure of the federal deficit is the change in the nominal par value of the federal debt. Eisner argues that the correct mea-

sure is the change in the real market value of the federal debt. The two measures differ whenever the price level or the level of nominal interest rates changes. Since the late 1960s, the difference has been substantial because inflation and rising nominal interest rates have eroded the real market value of previously issued government debt.

Eisner characterizes the U.S. economy as follows: if it is operating with slack, aggregate demand determines output, and the price level is predetermined; monetary policy determines the level of nominal interest rates; and households treat the real market value of government debt as net wealth. In this Keynesian economy, Eisner's measure of the federal deficit is the principal instrument by which the federal government can influence aggregate demand: a policy action that raises his measure will increase output. In contrast, aggregate demand need not be closely linked to the official measure. For example, an increase in the "animal spirits" of oil exporters could increase the inflation rate and thus the official measure while lowering aggregate demand. Alternatively, a tight monetary policy would increase nominal interest rates and the official measure but would decrease Eisner's measure.

If Eisner's characterization of the U.S. economy is invalid, his measure of the federal deficit is invalid as well. Suppose that the following model characterizes the U.S. economy: the price level is determined by anticipated aggregate demand; households treat the government debt as net wealth; and monetary policy fixes the fraction of government debt that is monetized. In this model, the official deficit is the correct measure because the nominal government debt plays exactly the same role as the nominal money supply plays in monetarist models. The official measure is clearly preferable to Eisner's for highly inflationary economies. For example, adopting Eisner's definition would lead one to the absurd view that in 1923 Germany had large surpluses and its hyperinflation resulted from animal spirits.

Suppose instead that Ricardian equivalence holds. In this case, the correct measure of the deficit is always zero because the time precedence of tax revenue does not affect aggregate demand. The instruments of fiscal policy then consist of the amounts the government spends

and will spend, the composition of its spending now and in the future, and the structure and time profile of its marginal tax rates. The current budget debate is therefore as much to the point as any political debate is ever likely to be.

The second part of Eisner's argument uses an old-fashioned variant of the Keynesian model. In this model, output is almost always less than its full-employment level and consequently depends primarily on aggregate demand which affects the price level only if full employment has been attained. Intelligent policy therefore raises aggregate demand when the economy is operating with slack and judiciously lowers it in the rare event that full employment has been attained and inflation is a problem. Such a policy yields a permanent economic high.

Modern Keynesian models assume that economic agents have rational expectations when setting money wages and prices. Because money wages and prices are temporarily rigid, systematic aggregate-demand policy can stabilize output around its natural level. Rational expectations, however, prevent the gap between output and its natural level from differing from zero on average. In other words, systematic aggregate-demand policy cannot produce a permanent economic high. Rather, its principal permanent effect is on how the price level evolves. Therefore, the second part of Eisner's argument is invalid in modern Keynesian models.

The book contains four chapters of empirical evidence supporting Eisner's position. For example, Eisner argues that output grows more rapidly, the larger is his measure of the federal deficit. As evidence for this position, he reports regressions of the growth rate of output on his measure of the federal deficit and on other variables. He finds that the coefficients on his measure of the federal deficit are positive and statistically significant. It took me only two minutes of empirical work, however, to produce similar regressions in which Eisner's measures are not statistically significant. My point is not that output is unrelated to Eisner's measure of the federal deficit but rather that his estimates are not robust to minor specification changes and therefore provide little, if any, evidence for his position.

In conclusion, if money wages and prices exhibit appreciable short-run stickiness, one can make a reasonable case that the official measure of the federal budget deficit is faulty and that Eisner's measure is superior. Therefore, this book can contribute to improved policy making if it teaches politicians this lesson. The rest of the book, however, is a throwback to the 1960s. It would indeed be ironic if this is the part of the book that ends up most affecting future policy making.

PAUL EVANS

#### 400 International Economics

*Selected essays of Gottfried Haberler.* By GOTTFRIED HABERLER. Edited by ANTHONY Y. C. KOO. Cambridge, MA and London: MIT Press, 1985. Pp. xi, 652. \$65.00 ISBN 0-262-11105-5. JEL 86-0771

When the present reviewer first studied economics, at the University of Rangoon in the early fifties, there were two books that every "honors" student was expected to have some familiarity with. These were *Prosperity and Depression* and *The Theory of International Trade*, both by Gottfried Haberler. Both books were already established classics for a couple of decades. Students today have other, more technical reference works that they are expected to master, both in macroeconomics and international economics, but I cannot help feeling that they would still benefit enormously by some acquaintance with the mind of this truly great economist as revealed in those two classics and in the present generous selection of Haberler's essays, edited by Professor Anthony Koo. Among some of the things that they would learn are that logic and rigor in economics can be sustained at the highest level without recourse to extensive mathematics and that economic theory has to be used in combination with a knowledge of history and institutional context if it is to illuminate the problems of the real world.

This massive volume contains 27 essays, ranging in time from a 1925 essay translated from the German on Schumpeter's theory of money to several very recent pieces on macroeconomic and trade problems, including a thoughtful

evaluation of the rational expectations approach to macroeconomics, which is the last chapter of the book. The papers are distributed fairly evenly over the decades from the thirties to the eighties. If anything, there are signs of an acceleration in the seventies and eighties in the valuable bibliography of his writings that the volume includes. There are five sections, arranged by topic, with about a dozen papers each on international economics and macroeconomics and three on economic development.

The opening section on International Trade contains some of Haberler's most famous contributions. The first chapter is a translation of a 1930 German essay which replaces the linear Ricardian model of comparative cost with the modern concave production possibility frontier, which Haberler derives from the hypothesis that factors of production are, at least to some extent and especially in the short run, "specific" to particular sectors of the economy. This approach was formalized mathematically forty years later by Ronald Jones and Paul Samuelson, who called it the Ricardo-Viner model. It would not be inappropriate for Haberler's name to be added to this distinguished lineage. Indeed, a case could be made that his "opportunity cost" approach is more in conformity with the spirit of this model than the "real cost" approach of Viner.

Chapter 3 is the celebrated 1950 *Economic Journal* article on "Some Problems in the Pure Theory of International Trade." This pearl was the product of irritation initiated by Thomas Balogh's belief that the familiar list of unrealistic assumptions usually made in expounding the theory of comparative advantage and the associated case for free trade are logically necessary for the validity of the conclusion. Haberler carefully examines several cases in which these simplifying assumptions are removed. In the process he may be said to have initiated the extensive literature on trade and trade policy in the presence of domestic "distortions" of various sorts in the markets for goods and factors that was developed in the sixties after a major contribution by Jagdish Bhagwati and V. K. Ramaswami.

The 1958 *Princeton Survey of International*

*Trade Theory* is published as Chapter 4. It still makes interesting reading in spite of the considerable theoretical developments that have taken place subsequently. A very thorough exposition of the "elasticities" approach to devaluation in a 1949 *Kyklos* paper is the analytical centerpiece of the next section on International Finance. Joan Robinson and Fritz Machlup were the pioneers on this topic but Haberler carried the analysis much further. It is regrettable that there is no postscript to this article, connecting it to the subsequent "absorption" and "monetary" approaches. Haberler distinguishes his analysis from the purely "real" Marshallian "reciprocal supply and demand" model by saying that he is concerned with demand and supply in terms of *money*, but the exact nature of the monetary assumptions that he makes is not clear. The literature still appears to be lacking a systematic exposition of the relationship between these diverse treatments of exchange rate devaluation.

Haberler is characteristically wise and insightful in several recent policy pieces on such topics as the impact of oil shocks and role of floating exchange rates, of which he has continued to be a vigorous advocate, given the world of downward nominal price rigidity that he believes we live in. His general macroeconomic position is firmly in the middle ground between Keynesians on the left and "new classicals" on the right. The last essay in the volume contains a succinct evaluation of the limitations of the more extreme formulations of the rational expectations position.

While it is possible to think of other authors for each of the essays reprinted in this book, Jacob Viner say for some of the trade pieces or William Fellner for some of the macro items, the only possible author for the volume as a whole is the man who wrote *Prosperity and Depression* and *The Theory of International Trade*. The generation of economists that was not brought up on those two classics can perhaps be led back to them by sampling some of the rich fare that this splendid collection has to offer.

RONALD FINDLAY

Columbia University

430 BALANCE OF PAYMENTS;  
INTERNATIONAL FINANCE

*The political economy of international monetary interdependence.* By KOICHI HAMADA. Translated by CHARLES YUJI HOKIOKA AND CHI-HUNG KWAN. Cambridge, MA and London: MIT Press, 1985. Pp. ix, 187. \$22.50. ISBN 0-262-08154-7. JEL 86-0794

This appropriately-titled book uses a series of sensible models to explore economic interactions between countries under alternate exchange-rate regimes. The models are simple ones, the algebra and notation are neat, and the language and logic are clear, so the reader is exposed to an effective demonstration of how to use game theory and adaptive expectations macro modeling techniques to derive relevant policy conclusions.

Chapter 1 describes the plan of the book. Chapter 2 lays out the basic options for the structure of the international monetary system, with a discussion of how game theory can be useful in thinking about these choices and an appendix discussing important elements of game theory.

Chapter 3 analyzes the formation of a currency union as an example of the provision of a public good. The author argues that when a nation joins a monetary union, it suffers certain costs (e.g., lessened ability to inflate at the desired level) in order to create a public good (e.g., reduced transactions costs). He then argues that the fact that the benefits of the public good are spread out among all of the members of the currency union will mean that monetary union formation will cease before optimal size is reached. This analysis seems flawed to me. When one more country joins the currency union, each current member and the prospective member all bear costs, and they all share the public good. Thus it is hard to find a systematic bias against the optimal size of the union here. To get such a bias, one must assume that the prospective members are discriminated against in the macroeconomic policy-making process and (as the author explicitly assumed) that efficient bargains are explicitly ruled out (e.g., join me in a currency union and I will take over more of your contributions to NATO). The author points out other reasons for the suboptimal size of monetary unions: the fact

that the costs are immediate and concrete (e.g., loss of sovereignty) and the macroeconomic benefits are speculative and deferred (e.g., the increase in efficiency that a common currency brings). However, if one thinks of the transactions cost inflicted by a floating exchange rate as a tax on transactions between the country and the currency area, it stands to reason that the smaller unit will bear most of the incidence of that tax. Thus it may well be that the new entrant will be the major recipient of the collective benefits from joining, so that suboptimality flows from failure of the initial members to get their just deserts.

However, one must certainly grant the author the more general point that when cooperation bestows benefits and costs asymmetrically, and compensation is ruled out, there will be too little cooperation, and that to facilitate cooperation mechanisms are needed to apportion the costs of cooperation appropriately among the beneficiaries (e.g., a common government).

Chapter 4 builds a model of monetary policy games with fixed price economies under fixed and flexible exchange rates with governments that care about the level of output, and under fixed exchange rates about the level of reserves as well. The analysis is used to demonstrate that under fixed exchange rates cooperation is needed to get onto the contract curve, but under flexible exchange rates, since countries have been freed from the need to be concerned about reserve levels, output levels in both countries will be optimized even without cooperation.

Chapter 5 analyzes policy games in a world of full employment and fixed exchange rates in which each government cares about the rate of change of nominal reserve stocks and the inflation rate. Conclusions are then drawn about the optimal rate of creation of international reserves.

One minor blemish is that the second term in the utility function on page 86 is not the rate of normalized real reserve growth as the author claims except when reserves are at their target level. I can not come up with a sensible interpretation of that term, and think that a better term would be  $\mu^e - \mu^*$ , where  $\mu^*$  is the target reserve/income ratio and  $\mu^e$  is the equilibrium  $\mu$  that would result if the rate of credit-based monetary growth remained un-

changed. Also, equation (5A.2) needs the addition of a factor  $(1 - z)$  on the right-hand side where  $z$  is the actual ratio of reserves to money in the world. Since  $z$  varies over time, the correct solution of the differential game in this appendix is somewhat more complex than his version of it.

Chapter 6 is a particularly clear, useful, and easy to follow discussion of adjustment for a small open economy with an expectations-augmented Phillips curve and adaptive expectations under fixed and flexible exchange rates.

Chapter 7 explores the transmission of disturbances in the world of Chapter 6 when both countries are of comparable size. I have one hobby horse to ride here: In his discussion of the Laursen-Metzler effect the author ignores the point made by Tower and Willett in our (1976) Princeton Special Paper that consumption functions fixed in real terms perfectly insulate real consumption from foreign developments under flexible exchange rates when prices are fixed and capital is immobile. Then, a foreign contraction which worsens the home terms of trade means that more home employment is required to sustain the same level of real consumption.

Chapter 8 explores monetary independence under a managed float. The conclusion succinctly summarizes the major findings and forthrightly tackles the potential criticism that the book uses adaptive rather than rational expectations and has no bonds. In the postscripts, the author neatly ties his results in with other recent developments.

To conclude, this is a monograph which is well worth reading, particularly for those who seek an introduction to the use of game theory in modeling macroeconomic interactions between nations.

### 520 BUSINESS FINANCE AND INVESTMENT

*Handbook of public economics. Volume 1.* Edited by ALAN J. AUERBACH AND MARTIN FELDSTEIN. Handbooks in Economics series, no. 4. New York and Oxford: North-Holland; distributed in the U.S. and Canada by Elsevier Science, NY, 1985. Pp. xvii, 484. \$130.00, two volume set. ISBN 0-444-87612-x. JEL 86-1097

As Alan Auerbach and Martin Feldstein observe in the introduction to the *Handbook of Public Economics*, public finance as a field is defined more by its objectives than its techniques. In fact many of the rapid changes in public finance over the past quarter of a century constitute the application of modern theoretical and econometric techniques to old questions about the role and impact of the government sector. The reader will find these traditional questions and a few new ones as the subjects of the seventeen chapters in this two volume set. Volume I, containing eight of the chapters, is the subject of this review.

Volume I opens with a thoughtful chapter by Richard Musgrave on "A Brief History of Fiscal Doctrine." Brevity is a challenge since the issues of fiscal doctrine constitute a large part of early thought on political economy. In this introductory chapter Musgrave identifies five broad themes in the doctrine—public goods, equity in taxation, efficiency in taxation, the general equilibrium effects (including the incidence) of taxation, and the role and impact of government debt and deficits—and traces the development of the major ideas in each to the present time.

To some extent Chapter 2 by Alan Auerbach on "The Theory of Excess Burden and Optimal Taxation" is also introductory as it develops the

main normative apparatus used in public finance. Auerbach examines the burden of taxation and how it is measured using the Marshallian concept of consumers surplus and the Hicksian concepts of equivalent and compensating income changes. There is a detailed explanation, perhaps more than some readers wish to know, of the problems associated with measuring the burden in principle and practice. After this catalogue of difficulties, Auerbach leaves the reader largely on his own as to how and when such measures can be usefully employed and turns to the subject of optimal taxation where the main results of a rather voluminous literature are derived and explained clearly.

In Chapter 3 Dieter Bös presents a comprehensive survey of "Public Sector Pricing." First he derives the necessary conditions for the social welfare maximizing values of the controlled prices in a general framework and then he considers the special cases. The classical marginal cost pricing rules emerge in the absence of public enterprise profit constraints, cross effects on distorted markets and in the presence of optimal lump-sum redistribution. Profit constraints lead to Ramsey pricing rules, possibly involving distributional weights if lump-sum redistribution is not possible, while distortions in other markets lead to other second best results. The various inadequacies of piece-meal policies are also documented.

In contrast to the theoretical emphasis of the previous two chapters, Jerry Hausman states in Chapter 4 on "Taxes on the Labor Supply" that theory tells us little about this subject so it is time to do econometrics. Hausman surveys the econometric issues involved in estimating labor supply functions in the presence of taxes in some detail, so this chapter will be useful for researchers planning to work in this area. The chapter also includes a good survey of the various negative income tax experiments carried out in the U.S. There is a very limited discussion of the intertemporal aspects of the labor supply problem and nothing at all on issues such as occupational choice and human capital accumulation.

Agnar Sandmo has written a characteristically lucid account of "The Effects of Taxation on Savings and Risk Taking" in Chapter 5. In the first part of the chapter he recites the standard

life-cycle analysis of the effects on saving of an income tax on wage and interest income with and without variable labor supply, imperfect capital markets, bequests and uncertainty. There is a brief survey of the burgeoning empirical literature on this subject and also a brief section on social security and saving. Following an analysis of the optimal tax treatment of saving, there is a well-organized survey of the literature on taxation and risk taking.

Avinash Dixit focuses his Chapter 6, "Tax Policy in Open Economies," almost entirely on commercial policies such as tariffs and quotas, a subject that has long been ignored by public finance specialists, partly because it is analyzed in detail elsewhere and partly because the policy objectives of trade taxes are perceived to be different than those of other taxes. Although he provides a well-written survey of the literature on commercial policy, I expect that some readers will be disappointed that he ignores a number of conventional public finance issues such as taxes and migration, tax treaties, origin versus destination taxation, international tax harmonization, tax reform in open economies, and the taxation of multinational firms and foreign capital income.

Harvey Rosen has written a good chapter on "Housing Subsidies" in Chapter 7. He observes that the housing market is subject to a large number of government interventions and considers the possible efficiency and equity rationales for them. The main focus is on subsidies to housing provided through preferential tax treatment and housing assistance. He reviews the tax provisions relating to the demand and supply of housing in the U.S. (many of which are found also in other countries) that have substantially lowered the user cost of owner-occupied housing with effects on tenure choice, investment in housing, economic efficiency and the distribution of welfare.

The last chapter in this volume is a methodical discussion of the (mostly) theoretical issues in "The Taxation of Natural Resources" by Terry Heaps and John Helliwell. The authors leave few, if any, significant issues on this topic uncovered. The different types of resource taxes and the possible objectives for resource taxation are reviewed and the taxation issues arising in selected resource industries are discussed including fisheries as an example of the common

property case, forestry for a renewable resource with competing uses, mining for the optimal extraction problem, and energy as the best rent-collection case. Economists interested in public finance or natural resource economics will find this chapter useful.

A handbook reviewer is inclined to offer an opinion on whether a particular handbook has achieved its stated objective of being "a definitive source, reference, and teaching supplement." Since only the first volume is reviewed here a final judgment is premature. The editors have assembled an impressive group of authors for the two volumes, and the authors in Volume I did, on the whole, a good job of conveying the existing state of knowledge in each chapter. As in most books of this type, there is a tendency for the theoretically inclined authors to slight the empirical literature and vice versa. As for general coverage, it appears from the table of contents for the two volumes that the major topics in modern public finance are covered with the notable exceptions of the public debt and tax reform. It is odd (especially considering the interests of the editors) that the public debt, a classic public finance topic and currently a major policy issue, did not rate a chapter. The absence of a chapter on the issues so widely discussed in the tax reform movements in the U.S. and elsewhere is less puzzling since many of these issues are covered in the individual chapters.

## 600 Industrial Organization; Technological Change; Industry Studies

### 610 INDUSTRIAL ORGANIZATION AND PUBLIC POLICY

*Competition in a dual economy.* By JOSEPH BOWRING. Princeton, NJ: Princeton University Press, 1986. Pp. vi, 208. \$25.00. ISBN 0-691-04234-9. JEL 87-0203

In this significant book, Bowring develops further the dualist view of the modern economy, using logic, history and statistical evidence. "Core" firms are large, stable, and profitable, and they commonly hold market power, whereas "peripheral firms" are small and powerless. Bowring aims only to establish that the distinction exists and is important, without go-

ing on to draw further lessons. The variety of evidence he presents is indeed inconsistent with dualism; and, as he notes, it undercuts the recent "efficient-market" claims that market power reflects only superior performance.

The book offers primarily a restatement of concepts and evidence in the industrial organization literature, plus new econometric tests relating corporate risk and return in the presence of various structural variables. After a concise introduction, Chapter 2 develops the concept of dualism, extending it from the earlier discussions by Galbraith, Averitt, Sweezy and others. The roles of absolute size, diversification, barriers to mobility, and risk and return, are adroitly discussed. A fundamental point is that core and periphery firms can coexist in individual markets. Therefore market power is a more sophisticated problem than is suggested by models based strictly on industry-wide degrees of monopoly.

Chapter 3 summarizes trends in the development of the core of large firms since 1900, stressing the rise of their concentration, diversification, stability and relative profitability. Chapter 4 attempts, less successfully I think, to contrast dualism with "the industrial organization tradition." In fact, Bowring's approach can be considered a variant within that mainstream analysis of market power. Rather, it is the recent "efficient market" approach that is eccentric in (1) assuming that markets have single homogeneous products, and (2) attempting to reverse the likely direction of causation while providing little supporting evidence.

In Chapter 5 Bowring surveys empirical evidence on the role of size, concluding that it supports the core-periphery distinction: "market power depends on both individual firm characteristics and on a group dynamic. They are equally important . . ." (p. 126). He also surveys the risk-return literature, to specify the core firms' access to higher quality (lower-risk) returns.

Chapter 6 presents Bowring's new analysis of IRS data on profitability and firm size, covering a sample of 154 small firms and a panel of all 572 firms which in 1969 had assets greater than \$25 million. He finds that profitability does differ between the two groups, after filtering out other influences. The reliance on yearly fluctuations of profits to indicate risk follows

common practice, but the problems of that short-term, retrospective and debatable index continue to be serious. Despite that, Bowring does offer consistent evidence based on commonly-accepted measures.

The whole effect is to give the core-periphery approach a firmer basis and to show how it conflicts (as does other mainstream evidence) with some of the more dubious recent claims about the nature of industrial organization. Yet the dualism hypothesis remains very much open to debate. For example, the superior position of core firms may have been substantially eroded by the evident instabilities among many large U.S. firms since 1970, as in steel, automobiles, and oil. There is certainly much more work to be done in showing the depth and margins of dualism and in drawing whatever implications it may have.

The writing is generally compact and balanced, and the evidence is nicely presented. The book is necessary reading for those interested in the role of large firms in the modern economy.

WILLIAM G. SHEPHERD

*The University of Massachusetts*

*Profits in the long run.* By DENNIS C. MUELLER. Cambridge, New York and Sydney: Cambridge University Press, 1986. Pp. xii, 378. \$44.50. ISBN 0-521-30683-0. JEL 87-0214

Until recently, a widely accepted view in industrial organization was that (1) industry structure determines the profit performance of all firms in an industry and (2) above normal profits are attributable to monopoly power arising from high industry concentration. This view is supported by many structure-performance studies that found a direct relationship between industry concentration and profitability. Challenges to the traditional view have materialized from a reinterpretation of old results (i.e., it is argued that cross-section results reflect transitory high profits); emergence of contestable markets theory (a special case of the theory of potential competition); and evidence that market share is more important in explaining firm profits than is industry concentration. The new view concludes that abnormal profits cannot persist because of contestable markets and the Schumpeterian dynamic competition process, and that high profits (presumably transitory) in concen-

trated markets reflect efficiency of firms with high market share. Consequently, there is no basis for concern about industry structure. This challenge has delineated perhaps the most important issue, from a policy perspective, in industrial organization today.

Mueller addresses this issue head on in a major empirical study. The main purpose is to determine whether abnormal firm profits persist in the long run and, if so, what explains these profits. The emphasis is on the relative explanatory power of firm and industry characteristics. Most previous structure-performance studies used industry variables in a short-run context. The empirical work is based on a sample of 551 companies from the Federal Trade Commission's 1950 and 1972 line of business surveys.

The empirical analysis proceeds along two lines—a firm and an industry model—to determine whether industry structure or firm-specific factors better explain firm profits. As the analysis proceeds along these two lines, the author adds variables chapter-by-chapter. Sequential addition of variables into the estimating model is supported by theoretical models. Occasional use of individual company cases to illustrate general statistical findings is interesting and illuminating.

Chapter 2 rejects the hypothesis that profits converge to a competitive level over time. The author concludes that the competitive process is operating too slowly in eroding abnormal profits. The effort to explain the persistence of abnormal profits occupies most of the remainder of the book.

Chapter 3 examines market share (power) stability over time. High profit firms tend to have high market shares suggesting that high market share may persist over time. Analysis of the identity of leading firms, by industry, over time indicates that high market share tends to persist, like high profits. Leadership stability is found to be greatest in high concentration industries and is weakened by rapid industry growth.

Chapters 4 to 8 present tests for the determinants of firm profitability. Models including both industry and firm-specific variables have greater explanatory power than purely industry variables. Firm market share is a particularly important determinant of firm profitability but

firm advertising and patent intensity are not, although *industry* advertising and patent intensity are. Industry concentration has a negative effect on firm profits possibly, according to the author, because of increased nonprice rivalry. This interpretation is based on the finding that advertising and patent intensity, when interacted with market share, are positively related to profits.

Managerial control of a firm is negatively (weakly) related to firm profitability. Firm growth is highly related to profitability but neither firm size nor diversification are. Merger variables indicate no synergistic effects but a simple averaging effect—profits of highly profitable firms are brought down by mergers while the opposite holds for low profit firms. Further, mergers tend to weaken the retention of market shares of merged firms. This also suggests mergers do not yield synergy and further that they do not drive out bad management.

Overall, the author concludes that the competitive process does not quickly erode abnormally high profits and leading firms' market shares. First-mover advantages and nonprice competition are cited as alternatives to efficiency for explaining high shares and profits. This leads the author to question the general relevance of contestability theory and the Schumpeter-Galbraith hypothesis that positions of market power will be quickly eroded. Consequently, an active antitrust policy toward mergers and industries characterized by high concentration and firm market shares is proposed, with more emphasis on nonprice competition.

The book has some weaknesses. Most importantly, I do not believe it demonstrates definitively that market share yields market power or that high profits reflect market power rather than efficiency, although a highly plausible case is made. The negative concentration-profitability relationship finding is contrary to traditional and "revisionist" theory. Some variables are subject to rather serious measurement problems, which the author acknowledges. Finally, the book is probably unavoidably difficult reading because of the large amount of data used and numerous models and hypotheses tested.

In spite of its weaknesses, this book is an important contribution to the debate over the existence and persistence of market power. The

author deserves kudos for entering the debate with a major empirical study in contrast with the all too frequent studies that offer essentially a replication and reinterpretation of others' work. I believe this book, including the appendixes detailing intertemporal industry matching, will be the basis for numerous studies as others pick over the ideas and data, and seek to refine tests of various hypotheses.

#### 620 ECONOMICS OF TECHNOLOGICAL CHANGE

*RCA and the VideoDisc: The business of research.* By MARGARET B. W. GRAHAM. Studies in Economic History and Policy, The United States in the Twentieth Century series. Cambridge, New York and Sydney: Cambridge University Press, 1986. Pp. xiv, 258. \$19.95. ISBN 0-521-32282-0.

JEL 87-0224

Written in "real time" over the period 1976 to 1986 and based largely on interviews with key RCA research and corporate personnel, Margaret Graham's book documents the market failure of RCA's VideoDisc technology. Heralded by RCA for its simplicity, reliability, ease of use, and low-cost appeal, VideoDisc was targeted for the perceived average television viewer: a viewer less concerned with having a video player with fancy features and more interested in simply sitting in front of the television and being entertained with movies, past television hits, sports, music, and self-instruction programming. At the time of VideoDisc's introduction to the consumer market in March 1981, RCA anticipated that a system consisting of a player priced at \$499 and vinyl discs retailing at \$14.98 to \$24.98 would generate \$7.5 billion in annual retail sales by 1990. Having invested over \$200 million on the technology by the time of launch, RCA viewed VideoDisc as its legitimate best hope for the future. The gamble failed and failed miserably, however. Compared to three-year projected sales of 3 million players, only 550,000 players were sold. In April 1984, RCA discontinued production of VideoDisc players altogether after losing roughly \$580 million dollars on the technology.

Margaret Graham's book points to five important reasons why RCA rolled a pair of snake

eyes. In the first place, RCA seriously misjudged the competitive threat from video cassette recorders (VCRs). RCA's market research revealed VCRs to be theoretically superior to video disks. While VideoDisc users could only watch the programming prerecorded on the disks, VCRs allowed home entertainment consumers to record their own programming, reuse tapes, record when not at home, and watch one program while recording another.

RCA's market research indicated that VideoDisc would do well relative to VCRs only with a substantial retail price advantage: 35 percent of those polled preferred VideoDisc if the RCA system retailed for \$300 and Sony's Betamax system (the strongest VCR competitor) remained at \$700. Although the 35-percent preference figure may have been valid at the over 100-percent price differential, the price differential never materialized. VideoDisc prices did nothing but rise while VCR prices fell steadily for both hardware and software. Many VCRs now retail for under \$200 and blank cassettes can be purchased for under \$6.

Second, RCA misplayed the rent-versus-own marketing approach for video discs. The company's research had consistently indicated that home entertainment consumers preferred to own something rather than to rent it. RCA consequently shunned a rental strategy for discs and focused instead on being the sole purveyor of programmed discs for its VideoDisc players: affiliated retailers were required to carry stocks of discs and the company entered into agreements with video programming suppliers which were for sales only.

The success of VCR rentals surprised RCA officials. The entry of chain outfits, such as Fotomat, and thousands of individual "video boutiques" served to lower rental prices and increase the quality of program offerings available to home entertainment customers. Much as most book readers do not accumulate their own personal repositories when public libraries are located nearby, home entertainment consumers could avoid tape storage costs and yet retain low-priced access to a wide variety of entertainment options through video rental outlets. Many VCR tapes could be rented for as little as \$2 per night at the time VideoDisc was launched. The independent outlets also leased adult films. Pornographic titles accounted for

as much as half of all revenues from video rentals but were not included in RCA's disc catalog because such titles violated RCA's family-oriented product image.

Third, the VideoDisc project lacked organization and direction from top management. Unlike the dedication and commitment that chairman Tom Watson displayed towards the IBM 360, that Edwin Land devoted to Polaroid's products, that Frederick Close of Alcoa applied to aluminum-clad skyscrapers and aluminum can sheet, and that David Sarnoff of RCA exhibited in the development of both black and white and color television technology in the 1940s and 1950s, Robert Sarnoff, chairman of RCA in the 1960s to 1970s, adopted a more hands-off approach to the development of VideoDisc. In contrast to his father, Robert rarely walked the corridors of the Laboratories and had to be persuaded by subordinates to learn more about the disc project and to attend key meetings reviewing the progress of the project.

Fourth, RCA attempted to institutionalize research by recruiting primarily academically-oriented scientists for the Laboratories after World War II. Unlike the research veterans who rarely had advanced degrees and who prided themselves on being inventors and on their prior attachments to one of RCA's manufacturing divisions, the young recruits were highly trained theoretically, oriented towards working on academic problems defined by their disciplines, but inexperienced in business. As these theoretically-inclined researchers moved into positions of authority, the Laboratories became something of a corporate counterculture, dominated by people who shared little in common with the rest of RCA. Under the direction of the theoreticians, the Laboratories acquired a reputation of being "the country club": a place where RCA resources were squandered on exotic and/or impractical ideas.

Finally, once the VideoDisc technology was first exposed to the press on March 19, 1975, RCA executives acquired too much of a stake in delivering on their public promises for the innovativeness of the new technology. After having come up short on numerous technological products (including computers) in the 1960s and early 1970s, RCA officers came to view VideoDisc as their do-or-die test. Delivering something, anything, that would herald a re-

turn to RCA's innovative glory days took too much precedence over bottom-line analysis. As one executive put it:

We announced Selectavision I (Holotape) and we didn't deliver; we announced Selectavision II (Magtape) and we didn't deliver; if we don't deliver on Selectavision III (VideoDisc) it could be strike three and out insofar as our technical image is concerned. (p. 193)

Although Margaret Graham's book is quite informative regarding the reasons for VideoDisc's failure, I have a few general criticisms about her writing style and method of analysis. For one, the book reads too much like the case study it was originally intended to be. There are a lot of facts and interesting stories but too few analytical themes. Two chapters, for example, are devoted to David Sarnoff: his friendship with Guglielmo Marconi, his speeches to the Harvard Business School in the 1920s, and his attempts to win FCC-approval for RCA's color television signal standard. No attention, however, is devoted to his son and successor, Robert Sarnoff—the man most directly responsible for the VideoDisc project. Outside of a few anecdotes, no attempt is made to analyze the different characters and leadership styles of father and son and the possible implications of these differences for the failure of VideoDisc.

The analysis of why RCA stuck with a nonrecordable disc technology as opposed to switching to VCRs is also not developed as fully as one would like; neither are the reasons for why RCA failed to adopt a rental strategy for discs once it began to see the success of VCR rentals. Graham makes a point of noting the technocratic style of the researchers RCA began to hire after World War II, but devotes too little attention to the argument that RCA's theoretically-oriented R&D staff may have been too far removed from the constraints of the business world during the development of VideoDisc. Too much time is instead spent presenting a maddening number of corporate organization charts (which are not well-integrated with the text), stories about which researchers came from what schools and corporations, and anecdotes about what corporate officers were trying to do with particular corporate logos. The comings and goings of the logo-dog "Nipper" listening to the sound of his master's voice get

as much play as does the leadership style of Robert Sarnoff.

The shortage of analysis cannot be faulted too greatly, however, given that the book was written without the benefit of historical perspective. Margaret Graham's interviewing and writing were already in progress when the fate of VideoDisc was still undetermined. And the uncertainty and constant flux of ideas and personnel surely reflect the tumult involved in researching and getting a new product to market. Although it is a case study of a single instance of corporate R&D failure, economists and captains of American industry may learn a great deal from reading Margaret Graham's book.

MARK A. ZUPAN

*University of Southern California*

*The positive sum strategy: Harnessing technology for economic growth.* Edited by RALPH LANDAU AND NATHAN ROSENBERG. Washington, DC: National Academy Press, 1986. Pp. xiv, 640. \$35.00. ISBN 0-309-03630-5.

JEL 86-0851

This book is an attempt to set up a dialogue between economists and engineers for a better understanding of the conditions "under which technological innovation can be made to function more effectively in the generation of economic growth." Introduced by editors Ralph Landau and Nathan Rosenberg, forty-three highly distinguished contributors—economists, technologists, entrepreneurs, educators, experts in business and in financing of innovation—address significant themes: technology and the dynamic of economic growth; policy, law, science and education as the framework of technological change; the economics of innovation; entrepreneurship and the management and financing of innovation; and technology and international economic competition.

This attempt is a successful one and comes at just the right time. The book is, first, useful for engineers. It shows how the successful design and manufacture of new products are tightly linked to economic variables; and how successful technological innovation involves the fulfillment of needs "as they are expressed in the market place where considerations of costs and adaptation to specific needs and determination of appropriate trade-offs between price and performance are likely to be critical" (p. vii).

To recognize that economic forces shape the environment for technological innovation is a major step toward success in fields of sophisticated technology.

This book is also useful for economists. Despite the fact that research in the past decades has conclusively established the critical role of technological change in generating long-term economic growth, economists have continued to treat the realm of technology as a "black box." By carefully listening to engineers, economists may improve the economic analysis of the innovation process in considering many issues (role of firm size; varying gestation periods and uncertainties of the innovation process; degree of interdependency between scientific research and the development process; relationship between macroeconomic theory; technical change and economic growth; dynamics of competition and productivity advances; and so on).

But beyond the dialogue it fosters between economists and engineers, the book is mostly beneficial to policy makers. As one of the authors, R. Malpas, says: "Harnessing technology for growth, however difficult, is essential for success, of a company and a nation, particularly in a sustained period of low growth" (p. 110). The authors point out the role played by governments in the innovative process. Governments aid R&D efforts, and by doing so induce learning-by-doing in the private sector, support large-scale projects not feasible in the private sector, establish on a macroeconomic level fiscal and monetary policy and on a more microeconomic (or second-tier level) tax or trade priority policies having varying effects on the innovation process. Above all, the proper role of government seems to be the creation of a favorable environment "in which new ideas and new enterprises are likely to flourish" (p. 535). E. Zschau cites four prerequisites for such an environment: a commitment to basic research, encouragement of risk taking, an adequate supply of trained technical people, and ample market opportunities. A good economic climate is the key to the successful integration of R&D with engineering, manufacturing and marketing.

In its discussions of economic policy, this volume reflects the growing perception of the importance of national and international financial systems (especially the venture capital system) to the process of technological innovation and economic growth. According to J. D. Marver

a general assessment of financing innovation through the public equity markets indicates that there is much less creativity in the financing of quality growth companies than in the financing of other types of corporations in the United States.

At a time when the United States has lost international competitiveness in a number of important industries, this book provides a good opportunity to rethink policies toward innovation. A real challenge is involved: a clear understanding of the role of innovation and a national consensus are required, particularly to match the Japanese resolve. On this topic, the volume poses provocative questions like: "Does the American system favor equity and risk aversion?" or "Will a system designed with an increasing concern for equity work as well to promote growth, in the light of increasingly competitive global markets?"

Even if we are left with many tantalizing questions, this volume clearly demonstrates that technology is "what makes an economy a positive sum game." It is a welcome step toward an extensive and effective collaboration between economists and technologists, all of whom deal with an extraordinarily complex and interdependent set of relationships. But only through their cooperation can a better understanding of the process of innovation be applied for the well-being of nations.

PATRICK COHENDET

*University of Strasbourg, France*

## 800 Manpower; Labor; Population

### 810 MANPOWER TRAINING AND ALLOCATION; LABOR FORCE AND SUPPLY

*Military technology and defense manpower.* By MARTIN BINKIN. Studies in Defense Policy series. Washington, DC: Brookings Institution, 1986. Pp. xi, 143. \$28.95, cloth; \$10.95, paper. ISBN 0-8157-0978-1. JEL 87-0067

American defense policy is founded on technological superiority over potential adversaries. The Russians are deterred, it is presumed, more by the legions in Silicon Valley than by the Watch on the Rhine. Critics of this posture question the reliability of much of the new technology under battlefield conditions and whether the United States can continue to recruit sufficient men and women with suitable

appropriate to the era of Star Wars. While the reliability issue has received considerable media attention, the recruitment problem has until recently been largely overlooked, in part because the recession of 1981-82 and changes in the political climate dramatically increased enlistments. The author of this useful study argues that the days of ready recruitment are over and the nation will face much more serious problems in meeting military manpower needs in the near future.

As is appropriate for a book reviewed in these pages, the problem involves both demand and supply. Since the 1950s increasing sophistication of weapons of war and the logistical problems posed by weapons systems support have led to substantial changes in the military jobs roster. While changes have varied, all service branches now require that a larger proportion of recruits show aptitude for operating and repairing electronic equipment. This upgrading of requirements reduces the pool of acceptable recruits. This reflects what is happening elsewhere in society: the "skills mismatch" issue is not unique to the military. What is more important according to the author is the substantial leap in military technology currently in progress. The changes are cataloged in the book; this collection will for most readers likely be at once impressive because of the scientific and engineering achievements involved and depressing because of the cataclysmic consequences should the new equipment ever be used.

The implications of this technological transformation for recruitment are controversial. Some experts argue that the new technology will reduce skill requirements by transferring responsibilities for operation and maintenance from people to machines. Others claim that the increasing complexity of military hardware will be accompanied by declining reliability and increasing difficulty of maintenance. These problems will, in turn, increase the demand for skilled maintenance personnel. Automatic diagnostics systems provide a case in point: these gadgets are intended to reduce maintenance skills needs by using electronic sensors to identify military systems components in need of repair. In practice, however, the automatic diagnostic systems themselves have been failure-prone; identifying when it is the sensor and not the machine that is malfunctioning calls for

exceptional skills. This, of course, creates a need for more of the types of personnel the systems were intended to replace. A case can be made that over time these problems can be solved, but here too the record is not encouraging. On balance, the author concludes, demand for electronics skills will grow.

On the supply side the central fact is that between 1980 and 1995 the absolute number of 18-21 year old males in the country will decline by 1.4 million or roughly 13 percent. Compared to the past, a larger proportion of the pool that remains will be members of minority groups. Recruits from minority groups as well as women have historically scored lower than white males on measures of aptitude related to electronics. Adjusting for trends in college attendance and assuming currently planned recruitment requirements, the armed forces by 1991-95 will be absorbing 55 percent of all males aged 18-21 not attending college and likely to meet mental and moral requirements for service, up from 50 percent in 1984-88. But if instead projections are made on the basis of currently planned military capital stock and organizational structure and it is assumed that the Army raises its entry standards to those now required by the Air Force, the services will require 77 percent of the pool of young men that meet the revised recruitment standards.

Something will have to give: with existing levels of remuneration and no recession, the services will never obtain this many qualified recruits. The last two chapters of the book are devoted to policy options for meeting the manpower shortage. These fall into four categories. The first is to raise pay. The author does not provide estimates of the potential cost of this option, although much work is available on the supply of military recruits. Rather, such options are dismissed as politically out of the question. The second is to undertake design changes for military hardware: provide simpler systems, improve reliability, make new systems more maintainable. While in principle it appears that opportunities exist for substantial improvement based on VHSIC (very high speed integrated circuit) technology and other innovations, history again causes the prudent observer to be skeptical. The third option involves improvements in military training that will allow use of recruits with lower basic aptitudes. And fi-

nally there are a series of management alternatives: (1) Expand the role of women (an unpromising source given recruitment experience and lower average aptitude in electronics); (2) substitute civilians (raises problems of pay comparability and wartime reliability); (3) increase retention of skilled personnel (already happening, but concentrated in lower-skilled ratings); and (4) return to conscription (might provide quantity, but quality is the problem).

The author's conclusions are that changes in manpower utilization are unlikely to alleviate the coming shortage, that training innovations are promising, and that "most worthy of special attention" are efforts at reducing the demand for highly qualified people by changing systems. This includes emphasizing simplicity, reliability, and ease of maintenance in system evaluation. Efforts are being made in this direction, but military preoccupation with quick fielding of maximum performance systems leaves little opportunity for serious pursuit of these other goals.

This is a valuable, easy-to-read book. The argument is strongest on demographics and manpower utilization options, weakest on technology evaluation and organization theory. Uncertainty about technology and organization is the crux of the matter: Do technological opportunities exist that will in fact permit economizing on human skills? Are there potential organization changes that would lead to incorporation of manpower and support considerations more systematically in military procurement? Since the author does not answer these questions, the principal achievement of the book is to convince the reader that the problem is serious. This is a beneficial first step.

MICHAEL WISEMAN

#### 820 LABOR MARKETS; PUBLIC POLICY

*The economics of comparable worth.* By MARK ALDRICH and ROBERT BUCHELE. Cambridge, MA: Harper and Row, Ballinger, 1986. Pp. xxiii, 180. \$29.95. ISBN 0-88730-073-1.

JEL 86-1235

The authors of this volume cast a wide net, beginning with a discussion of women's wages and employment opportunities in the nineteenth century and earlier reform efforts, in-

cluding some antecedents of comparable worth in the debate around equal pay legislation in the 1940s and 1950s (Ch. 1). They also discuss the current legal and political context in which comparable worth has emerged (Ch. 2), and they offer new empirical analyses of the likely future effects of comparable worth on wages, the quantity of employment, and the distribution of income (Chs. 5 & 6).

The contribution of the book lies principally in its critique of current methods for determining comparable worth wage adjustments and the authors' proposed alternative (Ch. 4). Using the theory of compensating differentials, they argue that the returns to job characteristics should be equal across occupations. Noting that discrimination may currently contribute to unequal returns between male and female dominated occupations, the authors develop their own "economists' model" of a comparable worth policy which would equalize these returns. They then juxtapose their model with a stylized version of an "advocates' model," and contrast the results in terms of their potential impact on wages, employment, and income distribution. They suggest that although the advocates' version of comparable worth has faults, the economists' version would provide a reasonable remedy for a limited labor market problem—low wages due to sex segregation. Moreover, they find that comparable worth wage adjustments would tend to favor the lower end of the income distribution, and benefit black women relatively more than white women—hence it is not solely a white middle class woman's issue, as its opponents often claim. Aldrich and Buchele also find that if comparable worth increased women's wages in women's jobs by 10.0 percent, employment losses would be on the order of 3.5 percent, resulting in a net increase of wage income for women.

In developing their own model, Aldrich and Buchele modify a method proposed in the 1981 National Academy of Sciences report by Treiman and Hartmann (*Women, Work and Wages: Equal Pay for Jobs of Equal Value*, Washington, DC: National Academy Press). Using a national data set, approximately 3300 men and women in their late 20s and 30s from the 1980 National Longitudinal Survey and variables from the *Dictionary of Occupational Titles* to proxy a job evaluation plan, Aldrich and Bu-

chele regress occupational wage rates against the job evaluation scores. They also add human capital variables, and controls for region and industry (to more closely mimic the experience of a firm, the context in which comparable worth is usually implemented). As in the National Academy of Sciences report, their model corrects for the bias of market wages by adding a variable for percent female of the occupation, but they also add interaction terms of percent female with all the other variables (to allow for the possibility that comparable worth type discrimination varies between more and less skilled jobs, for example). Adding the interaction terms is an improvement over the Academy proposal (and they find that without the interaction terms, discrimination is underestimated). However they overstate the extent to which their methods differ significantly from those used in the Academy report.

Two features of their proposed method are unique, however. First, they argue that separate equations for occupational wage rates should be estimated for male and female workers (that is, one equation is estimated using average male wages across all occupations, and a second is estimated using average female wages). Second, they suggest that in calculating comparable worth wage adjustments, the current practice of substituting values of the independent variables for female-dominated occupations into the male equation should be changed. They argue that the constant term (which they find to be important in many comparable worth applications) contains unknown components that contribute to the wage gap, but are not necessarily discriminatory. They propose to substitute the male coefficients into the female equation, thus leaving untouched the difference in intercepts. Their reasoning here can be objected to on the grounds that only those variables which are *uncorrelated* with the existing explanatory variables but correlated with sex will significantly affect the constant term. Such "magic bullets" have been searched for by those opposed to remedies for discrimination (which they believe nonexistent) for over two decades and have not yet been found. The constant term *does* reflect gender differences, even if we do not know why they arise. In fairness, Aldrich and Buchele always present two estimates, an upper bound esti-

mate for the effects of discrimination, which includes the constant term, and a lower-bound estimate which does not.

Their reasoning in support of regressing occupational wage rates separately for men and women is difficult to follow and in the end their method has bizarre results: men in women's occupations often wind up with bigger comparable worth wage adjustments than women in the same occupations, even though men are already better paid in those occupations than women are. This result occurs because percent female explains less of the variation in female wages than it does in male wages. They support their method by arguing that using one equation would conflate the effects of between-occupational wage differences with within-occupational wage differences; they believe comparable worth should correct for only the between-occupation differences, which they believe are small. Yet surely comparable worth advocates are not interested in preserving as best they can the within-occupation discrimination. In their effort to be distinct in what they are measuring, Aldrich and Buchele propose an alternative that has little policy appeal or relevance.

In the end their economists' model results in adjustments similar to those from the advocates' model (especially since they seem to suggest that the upper bound estimates are the more reasonable); a consensus seems to be emerging that comparable worth wage adjustments will increase women's wages on the order of 10-20 percent.

The book makes its most significant contribution in its last two substantive chapters that detail the distributional and employment effects. To our knowledge, Aldrich and Buchele are the first to have estimated the differential effects of *plausible* comparable worth wage adjustments by occupational category and demographic groups (black and white women and men). Theirs are also the first empirical estimates of likely wage gains and employment losses (again by broad occupational groups) on an economy-wide basis. Although it is important to remember that these empirical results are not based on wage adjustments that have actually occurred in a number of workplaces, but rather on an economists' model that has never been implemented (using a national data set and a hypothetical job evaluation plan based

on the DOT), the estimates do provide some very general guidance in an often uninformed debate.

On the whole the book succeeds in providing a balanced view of comparable worth and treating it with more economic rigor than many have. Yet because of its emphasis on minor or misguided technical embellishments it is unlikely to shape the comparable worth discussion in a significant way. Moreover, the book reads as though it started out as a technical monograph to which material of a more general nature was added while some of the technical details were suppressed. As such it may satisfy neither the technicians, who will have to work hard to figure out what the authors actually did in their empirical analysis, nor those wanting a comprehensive overview. Those doing serious research on comparable worth will find that it is not a substitute for—or an adequate summary of—the existing broader literature, yet will probably want to pay attention to the authors' specific findings.

*Unemployment benefits and unemployment duration: A study of men in the United Kingdom in the 1970s.* By A. B. ATKINSON AND JOHN MICKLEWRIGHT. London: London School of Economics and Political Science, Suntory-Toyota International Centre for Economics and Related Disciplines, 1985. Pp. vii, 282. £10.00, paper. ISBN 0-85328-098-3.

JEL 87-0277

The effect of unemployment benefits on unemployment duration has been the focus of extensive empirical investigation over the decade following the study by Ronald Ehrenberg and Ronald Oaxaca (1976). The view that unemployment insurance increases unemployment is widely held; the empirical issue is one of measurement. What do the data show? The objective of this careful book is to bring to light the complexities of the unemployment benefit system in the UK, the diversity of individual circumstances under the system, and the difficulty of analyzing its effects. In particular, Tony Atkinson and John Micklewright study the sensitivity of findings on the relation between bene-

fits and unemployment spell durations to the assumptions and decisions necessary to solve ambiguities of data and definition. They consider previous studies and present findings from their own analysis of a sample of 1231 men aged 16-64 drawn from the 1972-77 Family Expenditure Survey (FES). They also study the adequacy of the system in providing income support, noting that this, the "benefit" side of the system, has not been given the attention it deserves relative to the "cost" or disincentive side.

Following an introductory chapter, Chapter 2 sets out the institutional background of the unemployment benefit system in place in the UK in the 1970s. A brief sketch of the historical origins of the system is provided. This is followed by a detailed description of the eligibility requirements and major features of the three basic programs that comprised the system: the flat rate National Insurance benefit (NI), the Earnings Related Supplement (ERS, now defunct), and the means-tested Supplemental Benefit (SB). The many factors affecting the level of benefits actually received by an individual are discussed in detail. Many of these, the authors argue, are neglected in policy analyses and debate—including personal choice of whether and when an individual registers as unemployed and whether or not an application is filed for means-tested benefits. The authors also stress that the structure of the benefit system is such that benefit levels will vary significantly over the duration of a spell for most individuals so that use of a constant benefit amount for the duration of a spell is inappropriate. This point is important, as approximating a time-varying explanatory variable by a constant in duration models can lead to substantial bias.

Chapter 3 is devoted to a detailed comparison of several survey data sets in the UK.

In Chapter 4, both official statistics for the UK and the FES data are used to determine the extent to which benefits individuals actually received were different from the maximum benefits for which they were eligible. Some surprising statistics are presented. For example, in any given year from 1973 to 1979, less than sixty percent of men unemployed less than one year in the UK received the basic NI benefit. The reason for this low proportion, the authors report, is "linked spell exhaustion" of benefits—spells separated by less than thirteen weeks of

continuous employment are considered a single spell in determining eligibility. The authors also report that more than one fifth of all individuals eligible for the means-tested SB did not claim this benefit in the 1970s.

The next three chapters are devoted to "replacement rates." A variety of definitions for the replacement rate and the appropriateness of each for different purposes are the subject of Chapter 5. Chapter 6 provides a discussion of the difficulties involved in calculating some of these measures and then presents the authors' calculations of benefits and replacement rates for the FES sample under different sets of assumptions. In Chapter 7 the authors confront the view that the income maintenance system provides a high level of support. In terms of the adequacy of benefit levels, the authors report that between one in six and one in eight workers in their total sample of 1231 for the 1972-77 period had total unemployment incomes below ninety-five percent of a UK standard (the SB scale). The calculated replacement rates exhibit wide variation due to variation in the construction of measures of income. Chapters 8 and 9 turn to the effects of unemployment benefits on spell durations. The first of these two chapters focuses on the hazard rate studies of Tony Lancaster (1979) and Steve Nickell (1979). Differences across the two studies in implementing essentially the same statistical model (e.g., populations sampled, replacement rate definitions, and income measures) are discussed in detail, along with differences in results. Atkinson and Micklewright stress that most coefficients in both studies are imprecisely determined (a characteristic of many studies in this field) and argue that only under unrealistic values for the replacement rate are the benefit elasticities implied by the two studies close.

Chapter 9 presents the results from the authors' own hazard rate study based on the FES. They carry out a number of experiments to determine the robustness of the estimated replacement rate effect—so many experiments that keeping track of exactly what they are doing poses quite a task. Alternative benefit measures, different subsamples over time, alternative definitions of the replacement ratio, and different specifications of remaining regressors are all considered. The findings? The replacement rate coefficient estimates are generally im-

precise and there is wide variation in the benefit elasticities implied across the different specifications. The authors succeed in demonstrating that any size effect within a large range may be said to be supported by the data. In this sense the conclusion of the book is negative: The weight of the evidence is that the evidence is not weighty.

Much of what Atkinson and Micklewright discuss in the book is treated more briefly in Atkinson et al. (1984). Many economists will be sated by that article. Specialists will want full discussion and all the gory details (too often not available). Here they are.

JEL 87-0280

This book contains sixteen papers selected from those presented at a conference held at the University of Manchester in July, 1984. The first eight chapters are on unemployment and search behavior with the remaining chapters on labor supply. Most of the contributions are empirical with emphasis on policy issues. Thus, four of the six empirical papers on unemployment and search behavior study the impact of government programs on unemployment, three papers on labor supply analyze the impact of taxes, while another measures the incentive effects of disability insurance.

An interesting feature of the volume is the

wide array of data analyzed by the authors. Papers in the volume analyze both individual and aggregate time series data for several countries (Britain, France, Denmark and the United States). In addition, new sources of data are introduced. Heather Joshi, for example, introduces a new source of British female employment data, the Women and Employment Survey of 1980; C. V. Brown et al. report on an on-going research project, The Treasury Taxation Project, that gathered detailed information on individual payment schemes in Britain. Brown and his associates plan to use this information to provide complete and accurate descriptions of individual budget constraints in order to calibrate the extent of the bias in labor supply estimates generated by standard (crude but easily calculated) approximations of individual budget constraints (e.g., workers face a single wage for all hours of work). Upon completion, this project could make a significant contribution to our knowledge of labor supply behavior.

Another useful feature of the contributions is that, in accordance with the policy emphasis, several studies use simulation techniques to augment their estimates. A notable example is the paper by Richard Blundell et al., "A Labor Supply Model for the Simulation of Tax and Benefit Reforms," which is a nice blend of statistical estimation and policy analysis. The authors present a simulation algorithm for incorporating labor supply responses to evaluate tax reforms. They demonstrate the usefulness of the simulation procedure for tax analysis by four illustrative tax reform experiments. Analysts frequently simulate their estimated model to investigate policy effects. What makes the paper unique (or at least unusual) is that the authors perform diagnostic tests of the estimated model prior to the simulation experiments. Without this prior analysis to provide evidence that the model adequately describes observed behavior (at least in some measure), a simulation study is always open to the criticism that the results obtained are only due to the imposition of an arbitrary model structure onto the data. The application of the specification tests by Blundell et al. is also interesting because it illustrates that requiring a model to pass several tests is a difficult standard to achieve: Their preferred model, while dominating simple al-

ternatives, fails two of the four specification tests. It is disappointing that the authors do not comment on the implied model failure.

The gem of the volume, "On the Specification of Labour Supply Functions," is by Nicholas Stern. While not an empirical application, this paper will become a standard reference for empirical labor economists. In the first half of the paper, Stern develops and motivates eight criteria for selecting an empirical labor supply specification. Among Stern's criteria are: (1) consistency with utility maximization, (2) convenience in estimation, (4) ease of use in applied policy problems, and (8) flexibility in possible response of labor supply to changes in the wage. Thus, Stern's criteria are sufficiently broad to be useful for a wide range of applications.

Also useful is Stern's lucid discussion of the relationships among the labor supply function and the direct and indirect utility functions. Using duality concepts, in the second half of the paper, Stern fully characterizes the properties of twelve labor supply functional forms. This encyclopedic and clear discussion of the implied behavioral restrictions for all commonly used (and some not-so-common) labor supply specifications makes a real contribution to the labor supply literature. Diagrams are included of alternative parameter restrictions for most functional forms to help clarify the implied behavioral responses. For reference, in an appendix, each functional form has its own summary table. Anyone teaching a graduate course on labor supply will want to include Stern's paper on the reading list.

The papers in the volume are topical and the distinguished list of contributors will catch the attention of many. However, the book's usefulness is significantly undermined by poor and uneven editing. For example, data sources are not uniformly reported; three papers have data appendices while in another the data source is never reported. The unevenness extends to the presentation of the empirical results; e.g., in two papers, the authors discuss only one equation of multiequation systems, while in another supplemental estimates are reported in an appendix. Unfortunately, the unreported estimates are central to the analysis. A prime example is Joshi's paper which lists as one of its contributions a new method to impute women's earnings potential. She presents estimates of

the earnings equation without standard errors (or *t*-statistics) or other diagnostic information and refers the reader to a working paper for a fuller discussion. A simple presentation of the estimates does not provide the reader sufficient information to assess her stated contribution. Unfortunately, the Joshi example is not an isolated case. Many of the papers are not self-contained and, without access to the companion papers, it is impossible for the reader to assess many of the empirical findings. In a volume of primarily empirical papers, this is a major shortcoming.

The volume contains papers which are useful, some that expose the reader to several alternative sources of data and others that clarify important ideas. Unfortunately, too much of the important information was lost in the transition from the conference to the publisher.

JAMES R. WALKER

University of Wisconsin and NORC

*Inventing retirement: The development of occupational pensions in Britain.* By LESLIE HANNAH. Cambridge, New York and Sydney: Cambridge University Press, 1986. Pp. xi, 201. \$39.50. ISBN 0-521-30361-3.

JEL 87-0286

Retirement is a common feature of modern twentieth century industrial societies. The specific institutional arrangements that enable individuals to fund a period of leisure at the end of life are not. But as this interesting little book on the development of occupational pensions in Britain shows, the public policy issues surrounding the development of an integrated retirement system are remarkably similar.

The first part of the book details the growth of occupational pensions and their eventual integration with the compulsory publicly financed system. The author's theme is that the modern British occupational pension system was the product of three forces: the demand by individuals for a mechanism through which to save for retirement; a collective political demand for public provision of adequate income for all older people; and the evolving nature of the employment relationship in large bureaucratic enterprises.

As is true in the United States, occupational pensions in Britain offered individuals a means of reducing tax liabilities both by shielding in-

terest from taxation and by reducing the effective progressivity of the income tax by smoothing the receipt of life-cycle income. The author argues that the increasing progressivity of Britain's income tax after World War II spurred on individual demand for pensions. The resulting public policy debate between efficiency—double taxation on savings—and preserving the tax system's progressivity will be familiar to American readers.

The political pressure to increase the economic well-being of the aged resulted in a publicly financed system of old age benefits partly based on contributions but with a large transfer component. The main feature of this system which makes it quite different from ours is that firms can opt out of the public plan if their plan provides certain minimum benefits. The issues surrounding the public scheme's funding and the debate over the merits of pay-as-you-go financing will also be familiar to American audiences. Less familiar is the debate over the degree that public funds should explicitly be used to subsidize private plans in order to encourage them to match the publicly financed scheme's protection against inflation.

Large bureaucratic enterprises, which the author argues are internal labor markets completely separate from the competitive spot labor market, provide the final source of demand for occupational pensions. The author rightly stresses that this demand is based on the real productivity gains such compensation schemes generate.

Defined benefit pensions not only defer compensation but make the receipt of benefits contingent on specific future behavior. Hence these plans reduce turnover at younger ages, induce retirement at older ages, and enforce discipline throughout tenure with the firm. The matching of a firm's needs to those of its workers is achieved by offering lifetime compensation schemes whose benefits are most appealing to a select part of the work force—long stayers—whose planned labor force participation behavior is most attuned to the compensation package offered by the firm. Once these workers are employed they face systematic losses in lifetime compensation if they vary from their planned work path.

This is an important aspect of defined benefit plans and provides an extremely useful insight

into the role such pensions play in labor supply decisions. Unfortunately, the author almost totally ignores the last decade of literature on the neoclassical theory of pensions which links this form of "internal" compensation to the outside labor market. One of the clearest discussions of this implicit contract view of pensions and its implications for public policy is found in Ippolito (1986). Those interested in pension policy issues are well advised to read that book in conjunction with this one.

A closer consideration of the implicit contract literature and its emphasis on lifetime behavior would have been particularly useful in the second part of the book which discusses current pension policy in Britain. As is the case in the United States, most private pensions are defined benefit plans that link benefits to final wage earnings. The author recognizes that such plans penalize those who leave the firm early because, even if they are vested, their future benefit will be based on the last year worked. In such plans even modest inflation rates will substantially reduce the pension's real value at retirement.

Do workers recognize this as part of the implicit pension contract and make decisions accordingly? If so, to what degree should public policy intervene to reduce this penalty? The treatment of these questions, which British public policy is now struggling to answer, would have been greatly enhanced by developing them within a life-cycle framework.

The same can be said with respect to the exposition of the effects of the pension system on retirement age. The importance of replacement rates and mandatory retirement rules on retirement decisions is recognized. However, there is no discussion of how changes in the accrual value of pensions can influence the optimal age of retirement.

For instance Britain, unlike the United States, continues to allow firms to establish a mandatory retirement age. In the United States the present discounted value of most private pensions and certainly social security falls after age 65. Hence the removal of mandatory retirement rules at age 65 appears to have had very little effect on labor supply. A sensitivity to this aspect of pensions would enable the reader to judge the actual importance of mandatory retirement rules in Britain.

Despite these criticisms this book offers those interested in pension policy in this country a detailed picture of the development of an alternative system. The British system and its accompanying problems, well documented in this book, should give pause to those who believe a greater reliance on private pensions necessarily yields better retirement policy outcomes.

*Fighting poverty: What works and what doesn't*. Edited by SHELDON H. DANZIGER AND DANIEL H. WEINBERG. Cambridge, MA and London: Harvard University Press, 1986. Pp. viii, 418. \$27.50. ISBN 0-674-30085-8.

JEL 86-1267

This is a large volume of 14 not previously published papers and an introduction first presented at a conference held in December 1984. The purpose of the book and the conference is to summarize what we have learned from 20 years of actively fighting poverty in the United States, or as the subtitle of the volume attests: "What works and what doesn't." The papers are both voluminous and informative. While a great deal of the material presented could be culled from the earlier works of several of these authors, there is both fresh material and careful interpretive insight. Few edited volumes have papers that fit together as well as these do. As such, it will serve students in masters and graduate level courses in economics, public policy and social work as a useful complementary text. As a general reference work, there has been little useful material ever written about the War on Poverty that is not cited, summarized in the papers, and listed in the 38 page bibliography near the end of the book. The editors and authors are to be praised for the breadth and depth of their contributions.

Chapters 1, 14 and 15 present the volume synthesis, rapporteur's summary, and agenda for future research, respectively. They are useful as such, bringing together general themes of the 320 other pages in Chapters 2-13. The bottom line of the volume is that the current system of social policy is not so defective as its major critics, e.g., Charles Murray (1984), have argued. To be sure, to argue that "everything works" is no more appropriate than to claim "nothing works." As suggested by Gary Burtless (Ch. 2) and reiterated by the editors in Chapter 1, "nothing works miracles" is a more realistic claim for government antipoverty policy. To see what does and does not work is the challenge to the remaining substantive papers.

Chapters 2, 3 and 4 provide a thorough quantitative history and evaluation of the major programs and policies used to fight poverty from 1965-1985. These chapters—on public spending by Gary Burtless (Ch. 2); on a cost-benefit analysis of anti-poverty policy by Sheldon Danziger, Robert Haveman and Robert Plotnick (Ch. 3); and on welfare policy by David Ellwood and Lawrence Summers (Ch. 4)—provide a review of policy instruments and their effectiveness in reducing measured poverty. As the editors claim, some programs have worked (e.g., income transfers for the elderly and the disabled) and others have not (e.g., attempts to increase self-sufficiency through earnings for the able bodied poor). The evaluations are generally even-handed and informative. For instance, Ellwood and Summers' summary evaluation of the Aid to Families with Dependent Children (AFDC) program argues convincingly that AFDC does *not* disrupt the family, increase illegitimacy or dissolve marriages, but that a minor number of recipients tend to remain on the program for a long period of time. Yet mistakes can be made, even among this distinguished group. These same authors seem to misinterpret the relationship between recent changes in median income and poverty by ignoring recent changes in income inequality. Hence the papers should be read carefully.

The next set of contributions: Chapter 5 on health care policy, by Paul Starr; Chapter 6 on job creation and training programs, by Laurie Bassi and Orley Ashenfelter; and Chapter 7 on education and training by Nathan Glazer

(with a published comment by Christopher Jencks) review our experiences in the area of human resources. The good news here is that Medicaid and related health care and nutrition programs increased access to medical care by the poor; the bad news is that cutbacks in Medicaid outlays and lack of Medicaid coverage for most persons in two parent families has begun to erode the gains in health brought about by Medicaid. Perhaps the two most glum chapters are the balanced evaluations of education, training and job creation. If the War on Poverty was largely an attempt to put the poor to work, to increase their marketable skills via education and training and to create jobs for them, leading to long-term self-sufficiency as many (e.g.; Haveman 1977) have argued, herein lies its greatest failure. Yes, *some* programs worked *some* of the time for *some* people, and, as the editors suggest, outlays were insufficient to meet needs. However, if this is the key battle to be fought in the continuing war, we do not really yet know how to win it.

Chapter 8 by Rebecca Blank and Alan Blinder deals with the effects of the macroeconomy on poverty and points to the rising number of long-term and cyclically unemployed who are increasingly concentrated near or below the poverty line. The problem of direct income and payroll tax liability for the working poor is discussed in detail. Before the recent 1986 income tax reform bill was passed, a two parent family with two dependents and \$10,000 in annual earned income paid more in federal income and payroll taxes than the face value of Food Stamps for which they were eligible (Smeeding 1987)! If the family was ineligible for Medicaid and not living in public housing, two virtual certainties for this type of family in the early 1980s, the net effect of government programs of these working poor was to reduce their incomes. The 1986 tax reform bill was probably the most effective antipoverty bill passed under the Reagan Administration, because it remedied just this problem.

The next two chapters, by Mary Joe Bane (Ch. 9), and by William J. Wilson and Kathryn Neckerman (Ch. 10), deal with the issue of demographic change and poverty. In her usual direct and careful manner, Bane suggests that the feminization of poverty is more a reshuffling of poverty from poor two-parent to poor one-

parent households than it is a case of divorce and abandonment. Also she points to the increased concentration of elderly poverty among single older widows. Wilson and Neckerman argue that family breakup, especially in black families, is much more the result of black male joblessness than of the welfare system. Together these papers suggest that the black poverty dilemma is much more pernicious than the teenage pregnancy problem which the popular media chooses to emphasize. Chapter 12 on civil rights by Charles and Dona Hamilton underlines this conclusion.

In a very interesting chapter by Michael Sosin (Ch. 11) and comment by Lawrence Mead, welfare rights are debated. Sosin argues that the legal and social movements of the 1960s and 1970s that helped establish the rights of the poor to public aid were largely eroded by the bureaucratic rigidity and enforcement rules brought about under the Reagan administration. Mead argues that these rules and regulations were necessary to establish social obligations of work and child support upon the poor. While the increased enforcement of child support regulations on absent fathers is to be cheered, the reviewer would argue that the majority of the increased red tape was simply a result of the Reagan Office of Management and Budget's zeal to save money. In any case, both Sosin and Mead would, I think, agree that the system of aid to the poor has become less responsive and more rigid in recent years.

The final substantive chapter, by Hugh Heclo (Ch. 13), should be must reading for all economists interested in helping the poor. Here Heclo argues convincingly that the political constraints to doing something for the poor are so large at present that one needs to hide anti-poverty programs in a larger social agenda. Hence the income tax reform of the 1980s helped the poor even though increased eco-

nomic efficiency, tax simplification and lower marginal tax rates (mainly for the well-to-do) were its main calling cards; Food Stamps are consistently backed by the farm states despite the fact that the program has virtually no effect in generating higher food purchases among its recipients, etc. Faced with this political reality and a large budget deficit, it is hard to see how during the next few years the United States will be able to generate the \$5.0 billion or so that it takes to set a national minimum AFDC benefit, or even to target a less costly but equally effective antipoverty measure such as a Social Security/Supplemental Security Income benefit increase for elderly widows. On an even more gloomy note, it appears that it will be difficult to generate the jobs necessary to permanently reduce poverty as unemployment remains stuck at the seven percent level, four years into the recovery from the 1982 recession.

Perhaps, as suggested by Alfred J. Kahn of Columbia University at the close of the conference upon which the book is based, it is now a "seed time"—a time for the antipoverty warriors to regather their forces and wait for a more favorable political climate. If so, they would be wise to begin to build their programs on the solid foundation laid by this volume.

# Annotated Listing of New Books

## Editor's Note

Our policy is to annotate all English-language books on economics and related subjects that are sent to us. A very few foreign-language books are called to our attention and annotated by our consulting editors or others. Our staff does not monitor and order books published; therefore, if an annotation of a book does not appear six months after the publication date, please write to us or the publisher concerning the book.

An index to the *Annotated Listing of New Books* will appear at the end of the *General Index* in the December issue.

## 000 General Economics; Theory; History; Systems

### 010 GENERAL ECONOMICS

BLOCK, WALTER. *On economics and the Canadian bishops*. Focus series, no. 3. Vancouver: Fraser Institute, 1983. Pp. 76. Paper. ISBN 0-88975-057-2. JEL 87-0642

Critique of the recent statement entitled "Ethical Reflections on the Economic Crisis" prepared by the bishops of the Social Affairs Commission of the Canadian Conference of Catholic Bishops. Purpose is to promote an ongoing dialogue on economic questions from a religious and moral perspective. Discusses the principles of preferential option for the oppressed and priority of labor over capital upon which the report is based and highlights difficulties associated with them. Criticizes the strategies proposed in the report regarding curbing unemployment rather than inflation, the industrial strategy of low technology and high labor intensity, wage and price controls, welfare, and the role of labor unions. Reflects on report issues related to social Darwinism, profit, income distribution, business concentration, self-sufficiency, automation, job retraining, and North-South discrepancies. Examines overlooked issues of relevance for unemployment and the economic crisis including the effects of the Minimum Wage Law, corporate-state capitalism, and labor mobility. Lists suggested readings. Block is Senior Economist with the Fraser Institute and Director of the Centre for the Study of Economics and Religion, Vancouver. No index.

BLOCK, WALTER. *The U.S. bishops and their critics: An economic and ethical perspective*. Vancouver, British Columbia: Fraser Institute, 1986. Pp. ix, 127. \$5.00, paper. ISBN 0-88975-085-8. JEL 87-0643

A critical response to the Catholic Bishops' Pastoral Letter. Part 1 addresses its philosophical basis and points to fallacies and inconsistencies in the treatment of economic rights and liberties. Part 2 is devoted to the economic policy content of the Letter and critiques its advocacy of policies in the area of employment, poverty, economic collaborations, and international economics. An appendix discusses certain positive elements of the Bishops' Pastoral Letter. Block is Senior Economist and Director of the Centre for the Study of Economics and Religion at the Fraser Institute. Bibliography; no index.

BLOCK, WALTER AND HEXHAM, IRVING, eds. *Religion, economics and social thought*. Vancouver, British Columbia: Fraser Institute, 1986. Pp. xxii, 573. Paper. ISBN 0-88975-076-9. JEL 87-0644

Twelve papers with comments, discussions, or replies presented at an International Symposium on Religion, Economics, and Social Thought in Vancouver, British Columbia, in August 1982. The Roman Catholic view is presented in a discussion of classical social doctrine in the Roman Catholic church and recent Roman Catholic teaching—a shift to the left. Christian social thought is reviewed in essays discussing Christian political economy from Malthus to Margaret Thatcher and clerical *laissez faire*. The essays on Christian Socialism examine the legacy of the Christian Socialist movement in England and religious commitment and political judgment. Other papers discuss Christian social thought in the Dutch neo-Calvinist tradition, minority themes, and the World Council of Churches and social and economic issues. Judaic social thought is examined from the perspective of Judaism's historical response to economic, social, and political systems and Judaism and the market mechanism. The last part is devoted to Islamic social thought. An overview of the papers is also

presented. The contributors are mainly theologians, religious philosophers, and economists. Block is Director, Centre for the Study of Economics and Religion and Senior Economist at the Fraser Institute. Hexham is a Professor in the Department of Religious Studies, University of Calgary, Alberta. Index.

HEILBRONER, ROBERT L. AND GALBRAITH, JAMES K. *The economic problem*. Revised eighth edition. Englewood Cliffs, N.J.: Prentice-Hall, [1968 . . . 1984] 1987. Pp. xix, 737. ISBN 0-13-233081-4.

JEL 87-0645

The major difference in this edition is replacement of Lester Thurow by James Galbraith as co-author. [See JEL no. 84-0304 for annotation of the seventh edition.] Significant changes include an expanded international focus, introduced in part one, which examines the question of America in the world economy. This focus continues in parts 3 and 4, dealing with macro- and microeconomics. Other features include added material on why economists disagree, a new approach to the deficit and monetary issues, and new consideration of welfare, poverty, and regulation in the micro section. Chapters include a summary of key concepts, an economic vocabulary, and questions, as well as a preview as an introduction. Heilbroner is the Norman Thomas Professor at the New School for Social Research in New York City. Galbraith is an Associate Professor at the Lyndon B. Johnson School of Public Affairs, University of Texas. Glossary; index.

KLAY, ROBIN KENDRICK. *Counting the cost: The economics of Christian stewardship*. Grand Rapids, Mich.: Eerdmans, 1986. Pp. vii, 187. \$9.95, paper. ISBN 0-8028-0171-4.

JEL 87-0646

Describes the tools of economic analysis and explains how they can be used in the light of Christian faith and ethics. Examines the nature and necessity of economic choice wherever private and social wants outstrip available resources. Discusses issues with important economic and moral dimensions: poverty in the United States, poverty among nations, protecting air and water resources, land use, trade policy, role of government in the economy, and U.S. security. Examines each of these issues in order to explore the facts, understand the economic forces at work, examine the policy options available, and provide linkages to Christian teachings. Chapters contain questions for further consideration. Klay is Associate Professor of Economics, Hope College, Holland, Michigan. No index.

MACFADYEN, ALAN J. AND MACFADYEN, HEATHER W., eds. *Economic Psychology: Intersections in theory and application*. Amsterdam; Oxford and Tokyo: North-Holland; distributed in the U.S. and

Canada by Elsevier Science, N.Y., 1986. Pp. viii, 687. \$92.50. ISBN 0-444-70072-2.

JEL 87-0647

Twenty papers, most with an editors' introduction, which consider economic psychology as a discipline. Topics include: economic phenomena from a psychological perspective, rational economic man, motivational constructs in psychology, opponent processes and the dynamics of consumption, microeconomics and the experimental analysis of behavior, economic interpretations of animal experiments, economic behavior and social learning, causal attributions in economic behavior, generation of psychological problems by economic variables, an eco-behavioral approach to social systems accounting, and time-allocation matrices and measures of the quality of life. The editors are at the University of Calgary. Name and subject indexes.

MCCONNELL, CAMPBELL R. *Economics: Principles, problems, and policies*. Tenth edition. New York; Auckland; Montreal and London: McGraw-Hill, [1963 . . . 1984] 1987. Pp. xxxi, 914. ISBN 0-07-044958-9.

JEL 87-0648

Tenth edition of a textbook designed to introduce the beginning economics student to those principles essential to an understanding of fundamental economic problems and policy alternatives. Changes include minor rewriting, updating, and the revitalization of pedagogical aids. Summary, terms and concepts, questions, study suggestions, and a "last word" follow each chapter. Also available are a *Study Guide*, programmed *Economic Concepts*, *Instructor's Resource Manual*, dual test banks, color transparencies, and software. McConnell is Professor of Economics at the University of Nebraska at Lincoln. Glossary; index.

PEARCE, DAVID W., ed. *The MIT dictionary of modern economics*. Third edition. Cambridge, Mass.: MIT Press, [1981, 1983] 1986. Pp. 462. \$12.50, paper. ISBN 0-262-66059-8.

JEL 87-0649

Updated and revised edition [see JEL no. 84-0011 for annotation of previous edition]. Coverage extends beyond the needs of first year students, yet does include basic phrases, concepts, and institutions. Entries contain cross references except where the item is self-contained. Includes many business terms, short biographies of celebrated economists, both living and dead, mathematical symbolism, and international institutions. Adds 150 definitions, bringing the total to 2,650 entries. Sixteen economists contributed to this edition. David W. Pearce is Professor of Political Economy at University College, London.

PHELPS, EDMUND S. *Political economy: An introductory text*. New York and London: Norton; Mark-

ham, Ontario: Penguin Books Canada, 1985. Pp. xviii, 618. ISBN 0-393-85312-2. JEL 87-0650

Introductory economics textbook, focusing on political economy. Covers the scope and methods of economics, simple bilateral exchange, multilateral exchange, classical market theory and economic policy, the critique of classical system by Marx and the New Left, modern market equilibrium theory, and disequilibrium in modern market theory. Chapters contain summaries, important concepts, and study questions. The author is McVickar Professor of Political Economy at Columbia University. Index.

POWELSON, JACK. *Facing social revolution: The personal journey of a Quaker economist*. With a foreword by JIM CORBETT and an afterword by KENNETH BOULDING. Boulder, Colo.: Horizon Society in cooperation with the Social Order Series of the Pacific Yearly Meeting of the Religious Society of Friends, 1987. Pp. v, 146. \$6.95, paper. ISBN 0-934449-03-1. JEL 87-0651

An account of the author's search for a compatible intellectual and religious view of the world. Part 1 highlights twenty-five years of the author's professional assignments and experiences in the third world as a consultant to various governments and staff member of international organizations, the IMF, Inter-American Development Bank, and Ford Foundation. Part 2 examines the record of history to add more meaning to the author's personal experiences and, in particular, those related to the chasm between rich and poor. Some topics are: land reforms by leverage vs. land reforms by grace; slavery; capital and profit; liberation theology; revolution; sanctions; and pacifism. The final chapter lists insights acquired by the author about the rightness of plural societies, decentralization of power, widespread ownership of wealth, compromise and conflict resolution rather than violence, and the importance of the slow growth of institutions. The author is Professor of Economics at the University of Colorado. Index.

REYNOLDS, LLOYD G. *The American economy in perspective*. Second edition. New York; Auckland; London and Montreal: McGraw-Hill, [1981] 1987. Pp. xxi, 489. \$24.95, paper. ISBN 0-07-052056-9. JEL 87-0652

Updated introductory economics textbook designed for a one-semester course for undergraduates. [For annotation of the first edition, see JEL no. 81-0618.] This edition simplifies some of the first edition language and includes updated statistics. Combines text and study guide to be self-contained. Chapters include listing of key points, "think about this" questions, list of key concepts,

chapter summary, and a study guide section with questions for self-testing by the student. Each chapter is self-contained so that sequence may be altered, though format follows a macro-micro model. In five parts: basic ideas, stability, efficiency, equity, and the world outside. Includes an economic dictionary. Reynolds is Sterling Professor Emeritus of Economics at Yale University. Index.

RUSSELL, JOHN J.; LEE, PATRICIA BECKER AND O'SHEA, ARGIE M., eds. *National trade and professional associations of the United States*, 1987. Twenty-second annual edition. Washington, D.C.: Columbia Books, 1987. Pp. 453. \$60.00, cloth; \$50.00, paper. ISBN 0-910416-63-X, pbk. JEL 87-0653

A directory of national trade and professional associations, including labor unions, technical societies, and other organizations with national memberships. Contains an alphabetical list of over 6000 organizations. Also includes a lists of association management companies. Entries include name of executive director, size of membership, number of staff members, annual budget, relevant historical notes, publications, and dates of meetings. Directory information is also available in mailing list form. Subject, geographic, budget, and acronym indexes.

WHITEHEAD, DAVID J., ed. *Economics education: A second handbook for economics teachers*. London; Melbourne; Portsmouth, N.H. and Kingston: Heinemann Educational Books, 1986. Pp. 294. \$12.50, paper. ISBN 0-435-33750-5. JEL 87-0654

A handbook for economics teachers contains sixty-one papers, most previously unpublished. Organized in three parts: teaching economics to the 13-16 age range; teaching economics to the 16-19 age range; and resources, assessment, and organization. The contributors are teachers of economics. Whitehead is Senior Lecturer in Economics Education at the London University Institute of Education. Annotated list of useful addresses in England; index.

See also: Book Number JEL 87-0686

## 020 GENERAL ECONOMIC THEORY

[ARROW, KENNETH J.] *Equilibrium analysis: Essays in honor of Kenneth J. Arrow*. Volume 2. Edited by WALTER P. HELLER, ROSS M. STARR, AND DAVID A. STARRETT. Cambridge; New York and Melbourne: Cambridge University Press, 1986. Pp. xi, 318. \$34.50. ISBN 0-521-30455-5. JEL 87-0655

Twelve papers discuss current issues in equilibrium analysis. Part 1 deals with general equilibrium and includes a general equilibrium theory of North-South trade; a theory of occupational choice related to army recruitment; analysis of the dynamics of industry-wide learning; decentralized trade in a credit economy; public debt in the overlapping generations model; and coordination failure under complete markets. Part 2 discusses microfoundations of macroeconomics and covers price flexibility, inventory behavior, and production behavior; asymmetric information, unemployment, and inflexible wages; asymmetric adjustment costs and sectoral shifts; implicit contracts and risk aversion; non-Walrasian analysis; and monopolistic competition and the multiplier. [See JEL nos. 87-0656 and 87-0657 for annotations of Volumes 1 and 3, respectively.] The contributors are mainly economists. Heller and Starr are both at the University of California, San Diego. Starrett is at Stanford University. Author index.

[ARROW, KENNETH J.] *Social choice and public decision making: Essays in honor of Kenneth J. Arrow*. Volume 1. Edited by WALTER P. HELLER, ROSS M. STARR, AND DAVID A. STARRETT. Cambridge; New York and Sydney: Cambridge University Press, 1986. Pp. xix, 215. \$34.50. ISBN 0-521-30454-7. JEL 87-0656

Ten papers review topics in social choice and decision making in the public sector. Part 1 discusses issues in social choice and covers: consequentialist social norms; information and invariance in normative choice; the relevance of utilitarian morality; social choice rules in irrational societies; and axiomatic approaches to Walrasian social choice. Part 2 deals with approaches to public decision making. Topics include: testing for optimality in the absence of convexity; a theory of planning; the social risk premium; the determination of financial market equilibrium when the timing of tax payments is indeterminate; and the shadow price of capital. [See JEL nos. 87-0655 and 87-0657 for annotations of Volume 2 and 3, respectively.] The contributors are mainly economists. Heller and Starr are both at the University of California, San Diego. Starrett is at Stanford University. Author index.

[ARROW, KENNETH J.] *Uncertainty, information, and communication: Essays in honor of Kenneth J. Arrow*. Volume 3. Edited by WALTER P. HELLER, ROSS M. STARR, AND DAVID A. STARRETT. Cambridge; New York and Melbourne: Cambridge University Press, 1986. Pp. xx, 282. \$34.50. ISBN 0-521-32704-0. JEL 87-0657

Eleven papers discuss current issues in uncertainty, information, and communication. Part 1 deals with topics in uncertainty and covers: negotiation in games; exploitation of a long-term principal-agent relationship to escape inefficiency of short-term equilibria; the characteristics of competitive allocations in incomplete asset markets; asset pricing theories; personal probability axioms; and a new approach to univariate and multivariate comparisons of risk aversion. Part 2 covers topics in uncertainty, communication, and organization and includes analyses of the cost of communication in economic organization; assembling efficient organizations; optimal Bayesian mechanisms; incentive theory with data compression; and alternative limited communication systems. The contributors are mainly economists. [See JEL nos. 87-0656 and 87-0655 for annotations of Volumes 1 and 2, respectively.] Heller and Starr are at the University of California, San Diego. Starrett is at Stanford University. Author index.

BARRO, ROBERT J. *Macroeconomics*. Second edition. New York; Chichester; Toronto and Singapore: Wiley, [1984] 1987. Pp. xiv, 608. ISBN 0-471-85125-6. JEL 87-0658

Second edition of a textbook for undergraduate courses in intermediate macroeconomics. Presents and uses the market-clearing approach as a general method for analyzing real-world problems. Changes include: expanded treatment of employment and unemployment, changes in the expositions of rational-expectations macroeconomics and the Keynesian theory of business fluctuations, and shortening of material on microeconomic foundations and investment. Each chapter contains a summary, list of important terms and concepts, and questions and problems. [For annotation of first edition, see JEL no. 84-0961.] Barro is at the University of Rochester. Glossary; bibliography; author and subject indexes.

BROER, D. P. *Neoclassical theory and empirical models of aggregate firm behaviour*. Advanced Studies in Theoretical and Applied Econometrics series, vol. 8. Norwell, Mass.; Dordrecht, the Netherlands and Lancaster: Kluwer Academic, 1987. Pp. 343. \$69.00. ISBN 90-247-3412-6. JEL 87-0659

Investigates the construction of models that describe the aggregate behavior of business enterprises by the specification and empirical testing of a model in which aggregate business behavior results from the maximization of net worth subject to a number of constraints relating to the available technology, market conditions, and information. Analyzes the consequences of a number of assump-

tions about external conditions. Incorporates factor utilization rates and analyzes the link between those rates and factor stock adjustments. Explains firm decisions within a choice-theoretic framework, assuming vintage technology. Discusses the non-vintage model and the theoretical aspects of the vintage-related model. Tests both models on samples of Dutch and American data. Repeats the tests for the putty-clay model and compares the explanatory power of the two different technological assumptions. Concludes that neoclassical analysis can be successfully applied to the explanation of aggregate business behavior. Based on the author's doctoral dissertation, submitted to Erasmus University (1985). Author and subject indexes.

BÜTTLER, HANS-JÜRG; FREI, GERTRUD AND SCHIPS, BERND, eds. *Estimation of disequilibrium models*. Lecture Notes in Economics and Mathematical Systems series, vol. 279. New York; Berlin; London and Tokyo: Springer, 1986. Pp. 114. \$16.00, paper. ISBN 0-387-16817-6. JEL 87-0660

Discusses the use of disequilibrium models for analysis of single markets in disequilibrium. Reviews the nature of the debate regarding macroeconomic model building. Describes the process of specification of the canonical disequilibrium model and the estimation techniques employed. Demonstrates the applicability of these estimation techniques to the analysis of investment in residential construction, changes in the stock of money, and the aggregate labor market. Büttler is with the Swiss National Bank, Zurich. Frei and Schips are associated with Hochschule, St. Gallen, Switzerland. No index.

COLEMAN, JAMES S. *Individual interests and collective action: Selected essays*. Studies in Rationality and Social Change series. Cambridge; New York and Melbourne: Cambridge University Press in collaboration with Maison des Sciences de l'Homme, Paris, 1986. Pp. ix, 384. \$54.50. ISBN 0-521-30347-8. JEL 87-0661

Sixteen papers, fifteen previously published, present the author's central ideas in social theory. Papers investigate problems of social organization and the relation of the individual to collective action and are based on a paradigm of rational action. Six papers consider collective decisions and social choice as a fundamental problem in the functioning of social systems. The next six papers focus on power and discuss political money, control of collectivities and the power of a collectivity to act, constitutional power in experimental health service and delivery systems, the legitimate and illegitimate use of power, processes of concentration and dispersal of power in social systems, and the corpo-

rate structure of the economy and its effects on income. The remaining four papers examine questions about the creation of constitutions and the rights that are allocated in constitutions. Bibliography; index.

DIEWERT, WALTER E. *The measurement of the economic benefits of infrastructure services*. Lecture Notes in Economics and Mathematical Systems series, vol. 278. New York; Berlin; London and Tokyo: Springer, 1986. Pp. 202. \$23.10, paper. ISBN 0-387-16810-9. JEL 87-0662

Provides a methodology for evaluating the benefits (particularly to producers) of government infrastructure investments in utilities, communication, transportation, and land development. Develops a measure of infrastructure benefits and examines various concepts (e.g., willingness-to-pay functions, marginal cost functions, and approximate benefit measures) and problems associated with the producer benefit measurement and considers their advantages and disadvantages. Further explores the econometric approach with discussions about selection of a functional form, selection and measurement of variables, and the estimation of restricted profit functions in time-series and cross-sectional contexts. The appendices elaborate on properties of restricted profit, cost, and expenditure functions and proofs of propositions. Diewert is a member of the Department of Economics, University of British Columbia, Vancouver. No index.

DORNBUSCH, RUDIGER AND FISCHER, STANLEY. *Macro-economics*. Fourth edition. New York; Auckland; London and Montreal: McGraw Hill, [1978 . . . 1984] 1987. Pp. xiv, 798. \$36.95. ISBN 0-07-017776-7. JEL 87-0663

Revised and updated fourth edition of an introductory macroeconomics textbook [see JEL no. 84-0636 for annotation of the third edition], which presents theory and its empirical relevance and policy applications. Major changes include: open economy macroeconomics has been moved to the chapter on "international linkages"; the introduction to aggregate supply and demand precedes the chapters on aggregate demand; a new chapter on money, deficits, and inflation has been added; coverage of the microfoundations of macroeconomics and of the rational expectations-equilibrium approach has been increased; and the dynamic model of aggregate supply and demand has been restored to the text. Chapters conclude with a summary, listing of key terms, and problems. Instructor's manual, book of case studies and readings, data diskette, yearly updates, and a study guide are also available. The authors are members of the

Department of Economics, Massachusetts Institute of Technology. Index.

ELSTER, JON, ed. *The multiple self*. Studies in Rationality and Social Change series. Cambridge; New York and Sydney: Cambridge University Press in collaboration with Maison des Sciences de l'Homme, Paris, 1986. Pp. ix, 269. ISBN 0-521-28033-7. JEL 87-0664

Nine papers and an introduction by the editor on the study of the foundations of rationality. Most of the papers were originally presented at workshops set up under the auspices of the Maison des Sciences de l'Homme, Paris, in January 1980 and 1982. Papers explore the idea that the individual person may be seen as, or is, a set of sub-individual, relatively autonomous "selves," incorporating developments in philosophy, psychology, and economics. General study areas are: the loosely integrated self, self-deception and weakness of will, Faustian selves, hierarchical selves, successive selves, parallel selves, the Freudian legacy, split-brain theory, *homo economicus* and *homo sociologicus*, and the "no-self theory." Some specific topics are: self-deception and the voter's illusion; self-deception, *akrasia*, and irrationality; conflict among interests in a multiple self as a determinant of value; the mind as a consuming organ; and Goethe's *Faust*, Arrow's Possibility Theorem and the individual decision-taker. Contributors are mainly economists, philosophers, and psychologists. Elster is Professor of Political Science and Philosophy, University of Chicago. Index of names.

FABER, MALTE, ed. *Studies in Austrian capital theory, investment and time*. Lecture Notes in Economics and Mathematical Systems series, vol. 277. New York; Berlin; London and Tokyo: Springer, 1986. Pp. vi, 316. \$30.30, paper. ISBN 0-387-16804-4. JEL 87-0665

Seventeen papers, six published previously, that apply modern Austrian capital theory to models with finite and infinite horizons, problems of time irreversibility and investment, dynamic games with macroeconomic investment, and the treatment of time irreversibilities in economics. The first four papers outline the development of Austrian capital theory, relate it to Piero Sraffa's theory, present the Austrian subjectivists' pure time preference theory of interest, and discuss Austrian functionalist versus essentialist theories of interest. Two papers consider: (1) a neo-Austrian two-period multisector model of capital and (2) interest rates in a general multisector model of capital. Four papers concern models with infinite time horizons and discuss open-endedness of the future; propor-

tional prices with positive rate of interest relative to the growth rate; roundaboutness, nontightness, and Malinvaud prices; and competitive finite value prices. The next two papers discuss period vs. continuous analysis of time and production and flow-and-fund approaches to irreversible investment decisions. Four papers use a dynamic game-theoretical framework to analyze macroeconomic investment decisions under alternative market structures. The last paper applies lessons from the natural sciences to time irreversibilities in economics. The contributors are mainly economists. Faber is at the Alfred Weber Institute, University of Heidelberg. No index.

FELDERER, BERNHARD AND HOMBURG, STEFAN. *Macroeconomics and new macroeconomics*. Revised translation. New York; Berlin; London and Tokyo: Springer, [1984] 1987. Pp. xiii, 329. \$49.00. ISBN 0-387-16061-X. JEL 87-0666

Revised translation of the second edition of *Macroökonomik und Neue Macroökonomik* (1985), a textbook designed for both undergraduate and graduate students. Discusses the most important doctrines in a historical order, substantiating and criticizing each, and presenting major differences. Excludes some standard macro topics such as foreign trade and economic growth. Parts 1 and 2—fundamentals and macroeconomics—are designed for a one-term undergraduate course. They deal with methodological considerations, theories and models, equilibrium and disequilibrium, statics and dynamics, *ex post* and *ex ante* analysis, and partial versus total analysis. Also presents a historical survey including classicists, neoclassicists, and Keynesians. Reviews fundamentals of national income accounting. The classical and Keynesian views are presented in detail and are compared along with monetarism. Part 3 is intended for more advanced undergraduates and deals with more recent developments in macroeconomics, such as portfolio selection, monetarism, rational expectations, and neo-Keynesian disequilibrium theory. Chapters contain reading lists. Much of the mathematical analyses is contained in an appendix. Felderer and Homburg are at the University of Cologne. Bibliography; subject and author indexes.

FISCHER, STANLEY, ed. *NBER Macroeconomics Annual 1986*. Cambridge, Mass. and London: MIT Press, 1986. Pp. 409. \$35.00, paper. ISBN 0-262-56037-2. JEL 87-0667

A new annual series aiming to "encourage and disseminate research on real macroeconomic problems." This book includes six articles and discussions initially presented at a conference at Cambridge, Massachusetts in March 1986. Olivier J.

Blanchard and Lawrence H. Summers examine the causes of high unemployment in Europe. Fumio Hayashi examines why the Japanese have such a high rate of savings, emphasizing the importance of the extended family and bequests as causes. Martin S. Feldstein establishes links between the budget deficit and the exchange rate. Martin Eichenbaum and Kenneth J. Singleton present and interpret some new evidence on the validity of the real business cycle approach to cycle analysis. Lawrence F. Katz surveys recent developments in the literature on efficiency wage theories of unemployment. Martin L. Weitzman examines macroeconomic implications of profit sharing. No index.

FUERLE, RICHARD D. *The pure logic of choice*. New York: Vantage Press, 1986. Pp. xvii, 221. \$13.95. ISBN 0-533-06401-5. JEL 87-0668

Argues that economics is not an inductive, but a deductive science. Explores the foundations of economics and presents a restatement of a deductive theory of economics, called "praxeology" as suggested by Ludwig von Mises and others of the Austrian School. Discusses laws, proof of laws, and the basis of praxeology. Examines praxeological laws and non-consensual relationships as they relate to economics. The author's background is in economics and law. Glossary; bibliography; index.

GREENHUT, MELVIN L.; NORMAN, GEORGE AND HUNG, CHAO-SHUN. *The economics of imperfect competition: A spatial approach*. Cambridge; New York and Melbourne: Cambridge University Press, 1987. Pp. xix, 408. \$54.50, cloth; \$17.95, paper. ISBN 0-521-30552-7. JEL 87-0669

Application of spatial analysis to imperfect competition. Presents a theory of imperfect competition and nondiscriminatory pricing, considers its relevance to economic development and merger policies, and develops a spatial perspective on product differentiation. Outlines a model of discriminatory pricing and alternative demand conditions, considers alternative pricing policies, the nature of market overlap, intraindustry trade, constrained optimization, international and intranational pricing, dynamic market strategy, and heterogeneous prices and heterogeneous goods. Discusses the spatial approach to pricing, location, and competition and the nature of the long-run equilibrium properties of the imperfectly competitive economy. Greenhut is associated with Texas A&M University, Norman with the University of Leicester, and Hung with Florida Atlantic University. Bibliography; author and subject indexes.

HANNEQUART, ACHILLE AND GREFFE, XAVIER. *Economie des interventions sociales (Economics of social interventions)*. Paris: Economica and Cabay; distributed in North America by Diffuseur G. Vermette, Boucherville, Quebec, 1985. Pp. 264. Fr 96.00; Can\$ 27.50, paper. ISBN 2-87077-325-0. JEL 87-0670

The authors examine the rationale for government intervention in a modern economy. The book contains fifteen chapters dealing successively with the following themes: the role and the functions of bureaucratic organization; the regulatory process and judicial institutions; policy financing; measures and process for implementing a social intervention. Hannequart is a professor at the Catholic University of Louvain and of Mons (Belgium), and Greffe is a professor at the University of Paris-I and at the Ecole d'Administration Publique. Bibliography; no index. [Jean Mirucki]

HEILBRONER, ROBERT L. AND GALBRAITH, JAMES K. *Understanding macroeconomics*. Revised eighth edition. Englewood Cliffs, N.J.: Prentice-Hall, [1965 . . . 1984] 1987. Pp. x, 484. Paper. ISBN 0-13-936907-4. JEL 87-0671

Revised eighth edition of an introductory macroeconomics textbook [see JEL no. 84-0638 for annotation]. New focuses include greater emphasis on recession and international competition. Gives greater and extended treatment to issues and unresolved controversies relating to supply-side economics, monetarism and Keynesianism. Heilbroner and Lester Thurow were coauthors of the first eight editions. Chapters include a preview, a summary, an economic vocabulary, and questions. Heilbroner is the Norman Thomas Professor at the New School for Social Research. Galbraith is Associate Professor at the Lyndon B. Johnson School of Public Affairs, University of Texas at Austin. Glossary; index.

HEILBRONER, ROBERT L. AND GALBRAITH, JAMES K. *Understanding microeconomics*. Revised eighth edition. Englewood Cliffs, N.J.: Prentice-Hall, [1968 . . . 1984] 1987. Pp. xi, 454. Paper. ISBN 0-13-936915-5. JEL 87-0672

Revised and updated edition of an introductory microeconomics textbook [see JEL no. 84-0639 for annotation]. Text is divided into four parts: economic history and background, economic science, the market mechanism or microeconomics, and international economics. Previous editions were coauthored by Heilbroner and Lester Thurow. Chapters contain a preview, summary, vocabulary, and questions. Heilbroner is the Norman Thomas Professor at the New School for Social Research.

Galbraith is Associate Professor at the Lyndon B. Johnson School of Public Affairs, University of Texas at Austin. Glossary; index.

KRIPPENDORFF, KLAUS. *Information theory: Structural models for qualitative data*. Quantitative Applications in the Social Sciences Series, Sage University Paper, no. 62. Beverly Hills; London and New Delhi: Sage, 1986. Pp. 96. \$6.00, paper. ISBN 0-8039-2051-2. JEL 87-0673

Monograph on circular causal or simultaneous dependencies that escape analysis by most established techniques, written as a source book for social scientists and researchers and as a textbook for advanced undergraduate and graduate students. Presents those facets of information theory that are needed to search for and test structural models of qualitative data, i.e., models that exhibit complex relations among their component parts and rely on these relations to interpret given data. Topics include: qualitative data; selective information; entropy, diversity, and variety; Shannon's theory of communication; comparisons of qualitative variables; structural models; models with and without loops; information in models and in data; structural zeros; degrees of freedom; significance of information quantities; maximum entropy computations; and confirmation, exploration, and comparisons with other approaches. The author is a Professor at the Annenberg School of Communications, University of Pennsylvania. No index.

LAFFONT, JEAN-JACQUES. *Cours de théorie microéconomique*. Volume 2. *Economie de l'incertain et de l'information* (Course in microeconomic theory. Volume 2. *Economics of uncertainty and of information*). Economie et Statistiques Avancées. Paris: Economica; distributed in North America by Diffuseur G. Vermette, Boucherville, Quebec, 1985. Pp. 201. Fr 115.00; Can\$ 27.00, paper. ISBN 2-7178-0893-0. JEL 87-0674

The second volume of a graduate textbook on microeconomic theory is presented as a stand alone manual. The first four chapters describe analytical techniques on the theory of individual behavior in the presence of uncertainty, risk measurement and aversion, structure of information and the notion of certainty equivalence. The six remaining chapters deal with selective aspects of the theory of information: market equilibrium with uncertainty; market equilibrium with incomplete markets and rational expectations; risk-sharing and optimality in the stock market and in the insurance market; informationally efficient markets; equilibrium with asymmetric information. Five problems with detailed solutions are included at the end of

the volume. Laffont is a professor at the University of Toulouse and Directeur d'Etudes at the E.H.E.S.S., Paris. Bibliography; no index. [Jean Mirucki]

NICHOLSON, WALTER. *Intermediate microeconomics and its application*. Fourth edition. Chicago; Montreal; London and Sydney: Dryden, [1975 . . . 1983] 1987. Pp. xxvii, 627. ISBN 0-03-007799-0. JEL 87-0675

Fourth edition of an introductory textbook on microeconomic theory and applications. [See JEL no. 83-0330 for annotation of the previous edition.] Changes include: adoption of a two-color format, new chapters on the modern theory of the firm (including issues in implicit labor contracts, the principal-agent problem, and the market for corporate control) and public goods and public choice theory; revised and updated treatment of general equilibrium and welfare economics; expanded background material in elementary algebra, game theory, and the mathematics of compound interest; new learning aids; a new workbook and a study guide which is also available on computer disk; and reduction in the number of chapters by combining material that previously appeared in separate chapters. Chapters contain summaries, problems, and applications to current situations. Also contains solutions to odd-numbered problems. Nicholson is Professor of Economics, Amherst College. Glossary; author and subject indexes.

RASHID, SALIM. *Economies with many agents: An approach using nonstandard analysis*. Baltimore and London: Johns Hopkins University Press, 1987. Pp. xii, 160. \$30.00. ISBN 0-8018-3379-5. JEL 87-0676

Argues that nonstandard analysis is a powerful mathematical tool for rendering economic intuitions precise; illustrates this using the economic topic of economies with many agents. Chapters examine: why economists study economies with an infinite number of agents; what nonstandard analysis does; and the relationship of nonstandard models to standard approaches. Concludes with a comparison of nonstandard versus measure-theoretic models. Rashid is Professor of Economics, University of Illinois. Bibliography; author and subject indexes.

ROTH, TIMOTHY P. *The present state of consumer theory*. Lanham, Md. and London: University Press of America, 1987. Pp. vi, 168. \$26.50, cloth; \$13.75, paper. ISBN 0-8191-5700-0. JEL 87-0677

A critical assessment of current consumer theory. Discusses models and model building, commenting on the methodological positions of descriptivism, instrumentalism, and the explanatory-informative view. Analyzes ordinal utility theory, its postulates, and technical extensions. Examines the Lancasterian or "New Approach" to consumer theory, where the arguments in the utility function are characteristics of the goods and services. Discusses the multiequation utility function, the household production function, and procedural rationality and the technology of choice. Concludes with a postscript on empirical demand estimation. Roth is the A. B. Templeton Professor and Chairman of the Department of Economics and Finance at the University of Texas, El Paso. No index.

SARGENT, THOMAS J. *Dynamic macroeconomic theory*. Cambridge, Mass. and London: Harvard University Press, 1987. Pp. xii, 369. \$35.00. ISBN 0-674-21877-9. JEL 87-0678

Describes and illustrates several dynamic general equilibrium models and applies them to problems in macroeconomics and monetary economics; suitable for use in graduate-level courses. Introduces discounted dynamic programming, the theory of search, and asset prices and consumption. Then focuses on monetary economics and government finance. Introduces currency in the utility function model and considers and uses cash-in-advance models as well as models that relate to credit and currency with long-lived agents and with overlapping generations. The last chapter discusses government finance in stochastic overlapping generations models. Each chapter contains exercises and suggested readings. A companion book with answers to the exercises is also available. Sargent is Professor of Economics, University of Minnesota. Index.

SEMMLER, WILLI, ed. *Competition, instability, and nonlinear cycles: Proceedings of an international conference, New School for Social Research, New York, USA, March 1985*. Lecture Notes in Economics and Mathematical Systems series, vol. 275. New York; Berlin; London and Tokyo: Springer, 1986. Pp. xii, 340. \$35.20, paper. ISBN 0-387-16794-3. JEL 87-0679

Fifteen papers on competition, instability, and nonlinear cycles. Part 1 includes papers on modeling the cross-dual dynamics of competition and covers the dynamic equalization of profit rates, a cross-over gravitation process in prices and inventories, stability of production prices and ergodic price setting with technical progress. Part 2 deals with the microfoundations of macrodynamics and limit cycles and covers the price and quantity dy-

namics of a Sraffa/von Nuemann production price system, stability in a dynamic model of capitalist production, the microdynamics of a nonlinear macrocycle model, and stabilization policy in a business cycle model. Part 3 investigates linear and nonlinear macrodynamics and includes extensions of the classical growth cycle model, a Keynesian model with perfect foresight, and the interdependent dynamics of cyclical growth in industry and agriculture. Part 4 relates to the econometrics of the dynamics of proportions and nonlinear macrodynamics. The contributors are mainly economists. Semmler is a member of the Department of Economics, New School of Social Research. No index.

SUGDEN, ROBERT. *The economics of rights, co-operation and welfare*. Oxford and New York: Blackwell, 1986. Pp. vii, 191. \$45.00. ISBN 0-631-14449-8. JEL 87-0680

Investigates the extent to which people can, in a state of anarchy, coordinate their behavior and maintain a social order without the formal machinery of law and government. Contends that if individuals pursue their own interests in a state of anarchy, that order, in the form of conventions of behavior, can arise spontaneously. Argues that although the conventions need not significantly maximize social welfare, they tend to become norms and represent a coherent system of morality. Uses a game theory framework to analyze the evolution of rules of justice, discussing coordination, property, possession, reciprocity, free riders, natural law, and the coordination of rights, cooperation, and welfare. Sugden is Professor of Economics at the University of East Anglia. Index.

### 030 HISTORY OF ECONOMIC THOUGHT; METHODOLOGY

BABBAGE, CHARLES. *On the economy of machinery and manufactures*. Reprint of fourth edition enlarged. Reprints of Economic Classics series. Fairfield, N.J.: Kelley, [1832 . . . 1835] 1986. Pp. xxiv, 408. \$39.50. ISBN 0-678-00001-8.

JEL 87-0681

An attempt to present the reader with an enumeration of the mechanical principles underlying the application of machinery to arts and manufacturing, tracing the consequences of using machinery to replace the skill of the human arm. Comments on principles of political economy, noting their historical foundations and presenting facts and anecdotes to illustrate his thought about them. Discusses, among other topics, the advantages of

using machinery and manufacturing; accumulating and regulating power, describing several mechanical operations and making suggestions for better use; saving time; registering operations; economy of materials; methods for observing manufacturing; the influence of durability on price; raw materials; division of labor; position of large factories; proper circumstance for the application of machinery; combinations; how machines affect the demand for labor; legal restrictions; and exporting machinery. Concludes with a discussion of the relationship between science and machines. Includes prefaces to first three editions. Index.

BURTON, JOHN, ET AL. *Keynes's General Theory: Fifty years on, its relevance and irrelevance to modern times*. Hobart Paperback series, no. 24. London: Institute of Economic Affairs; distributed in North America by Transatlantic Arts, Albuquerque, N.M., 1986. Pp. viii, 159. \$9.50, paper. ISBN 0-255-36197-1.

JEL 87-0682

Discusses Keynes's *General Theory of Employment, Interest and Money* and the relevance of Keynes, especially in view of changing emphasis in economic analysis. In the introductory essay, "Fifty Years On: Background and Foreground," Burton describes the *General Theory* as challenging in many ways the entire tradition of classical economics. Discusses the Keynesian revolution and the "Age of Keynes," the emergence of stagflation and doubts, the monetarist reinterpretation, the resurgence of Austrian economics, expectations and the fundamental Keynesian view, the rational expectations revolution, and public choice and the motives of government—all as related to Keynesianism. Leland B. Yeager examines the Keynesian heritage in economics; Milton Friedman discusses Keynes's political legacy; Karl Brunner analyzes Keynes's intellectual legacy; Michael R. Darby and James R. Lothian investigate economic events and Keynesian ideas in the 1930s and the 1970s; Alan Walters examines consumption, savings, and the multiplier; Patrick Minford discusses expectations and the economy; Michael Beenstock considers secular stagnation and the world economy; and Alan Budd comments on Keynesian unemployment and the unemployment of Keynes. Burton is Research Director of the Institute of Economic Affairs. Glossary; no index.

DUMEZ, HÉRVÉ. *L'économiste, la science et le pouvoir: le cas Walras (The economist, science and power: The case of Walras)*. Paris: Presses Universitaires de France; distributed by Les Éditions Française, Boucherville, Quebec, 1985. Pp. 272. Fr 150.00; Can\$ 43.65, paper. ISBN 2-13039-065-1.

JEL 87-0683

Describes the development of the career of Léon Walras, and his confrontations with France's scientific and political institutions. The author considers Walras as a producer of a specific doctrine, who attempted to penetrate the markets of economic and political ideas in order to diffuse his own approach, given the sociological context at the turn of this century. The first part presents the environment in which Walras' career was evolving: the social demand for economic knowledge; the forms of economic training; economic concepts versus modeling techniques. The second part examines the path of his career and the progress of his ideas: the first obstacles; the nomination in Lausanne; the political contacts; the essence of his contribution. Dumez is a researcher at the Centre de Recherche en Gestion de l'Ecole Polytechnique (Paris). Bibliography; author and subject indexes. [Jean Mirucki]

ENGLAND, RICHARD W., ed. *Economic processes and political conflicts: Contributions to modern political economy*. New York and London: Praeger, 1987. Pp. x, 323. \$39.95. ISBN 0-275-92451-3.

JEL 87-0684

Fourteen essays, several published previously, dedicated to Dr. Sam Rosen, Professor Emeritus of Economics, University of New Hampshire. Papers focus on the recent history of economic thought in the United States from the perspective of radical economics. Each of the essays "reflects the premise that economic phenomena can be understood only within a historical context and that those phenomena are intertwined with political struggles." Divided into six parts: issues of methodology; precapitalist modes of production; profit, accumulation, and crisis; gender and class; labor, capital, and the state; and transition to socialism. Specific topics include: dialectic of matter versus dialectic of history; a critique of Michio Morishima's mathematical Marxism; class relations and predatory accumulation; Marxist rethinking of third world rural industrialization; accumulation and crisis; ecology, social class, and political conflict; women as a labor reserve; feminist theories of gender and class; class struggle and scientific management; state strategies of control in the public sector; and experiences in Algeria and Grenada. The contributors are mainly economists. England is Professor of Economics at the University of New Hampshire. Index.

FINE, BEN, ed. *The value dimension: Marx versus Ricardo and Sraffa*. Economy and Society series. London and New York: Routledge and Kegan Paul, 1986. Pp. 239. \$15.95, paper. ISBN 0-7102-0766-2.

JEL 87-0685

Eight papers, most previously published, present the major elements of the debate regarding the transformation problem. An introductory essay outlines the major strands in, and the evolution of, the debate regarding the Marxian problem of the transformation of values on prices. Papers examine the law of value in David Ricardo and Karl Marx; the importance of the transformation problem in Marx's *Critique of Political Economy*; I. Steedman's critique of Marx's theory of value; Marx's theory of agricultural rent; the "corn-profit" model and the views of Thomas R. Malthus, Ricardo, and Piero Sraffa; certain errors in the interpretation of Marx's views regarding the transformation of values and prices; and a reformulation of and solution to the problem. The contributors are: Ben Fine, Geoffrey Pilling, Ira Gerstein, Heiner Ganssmann, Gilbert Faccarello, and Guglielmo Carchedi. Fine is Reader in Economics at Birkbeck College, University of London. No index.

GHOSH, RANEN. *Economic science—Where to?* Calcutta: Ranitra Books, 1986. Pp. viii, 78. \$4.00, paper. JEL 87-0686

Offers a highly critical evaluation of today's economics, using criteria for determining whether a discipline is a science to evaluate economics. Classifies micro and macro theory and econometrics as the most scientific. Questions whether economics can justify its existence, pointing to the failures of economists in practical life, and criticizes economists for not being clear about the issues they discuss. Calls the concept of equilibrium a "serious misconception" and credits mathematical and econometric methods with salvaging economics. Sees the measurement of noneconomic qualitative variables and their effect on economic models and research in disequilibrium analysis as steps in a positive direction toward appropriate model-building and correct interpretation of estimated models. Contends that development economics has not made significant impact and that tools of planning, particularly input-output analysis, are simplistic and out of touch with real-life phenomena. Ghosh is an econometrician, currently engaged on research in Development Economics. Index.

HELBURN, SUZANNE W. AND BRAMHALL, DAVID F., eds. *Marx, Schumpeter, Keynes: A century celebration of dissent*. Armonk, N.Y. and London: Sharpe, 1986. Pp. xii, 343. \$35.00, cloth; \$16.95, paper. ISBN 0-87332-380-7. JEL 87-0687

Sixteen papers first presented at a symposium at the University of Colorado at Denver in April 1983, marking the 100th anniversary of the death of Karl Marx, the birth of John Maynard Keynes, and the centenary of the birth of Joseph A. Schum-

peter. Symposium was concerned with the questions asked by each and the role of dissent in economic thought. Part 1 discusses the place of economics in the study of society, how far economics as currently structured helps to understand the world, and the philosophy of science that underlies the study of economics. The next three parts are devoted to the analysis of Marx, Schumpeter, and Keynes, beginning in each instance with their research. Part 5 examines the impact of each of the three on selected research and policy issues, such as the prospects for advanced capitalist economies, the instability of the capitalist growth process, and government economic policy. The last part is a summary of the earlier themes. Helburn and Bramhall both are Professors of Economics at the University of Colorado at Denver. No index.

MALTHUS, THOMAS ROBERT. *Definitions in political economy*. Reprints in Economic Classics series. Fairfield, N.J.: Kelley, [1827] 1986. Pp. xvi, 261. \$29.50. ISBN 0-678-00018-2. JEL 87-0688

Contains Malthus's review of economic doctrine. Organized primarily around the meaning and usage of key terms by individual authors, but does consider some theoretical problems and develops some of Malthus's own ideas, including those on aggregate demand, measuring value over time, and Say's laws. States the object of the book is to "draw attention to an obstacle in the study of political economy," namely the differences of opinion among the political economists, and to set forth the foundation for a "correct definition and application of terms." After a brief presentation of the rules for definition and application of terms, examines the use of concepts by the Physiocrats, Adam Smith, M. Say, David Ricardo, James Mill, James Ramsey McCulloch, and an anonymous writer on value. The last two chapters present definitions and commentaries on them. No index.

MALTHUS, THOMAS ROBERT. *An essay on the principle of population or a view of its past and present effects on human happiness*. Reprint of seventh edition. Reprints of Economic Classics series. Fairfield, N.J.: Kelley, [1798 . . . 1972] 1986. Pp. xv, 551. \$39.50. ISBN 0-678-00638-8. JEL 87-0689

Historical examination of the effects of the principle of population on the state of society, in the attempt to give it a more "practical and permanent interest." The four books in the volume generally discuss checks to population in the past in the less civilized parts of the world, checks in then modern Europe, expedients to treat the evils of population growth, and future prospects for mitigating the

principle of population. Includes prefaces to the second and fifth editions. Index.

MALTHUS, THOMAS ROBERT. *Principles of political economy: Considered with a view to their practical application*. Reprint of second edition. With an introduction by MORTON PAGLIN. Reprints of Economic Classics series. Fairfield, N.J.: Kelley, [1820, 1836] 1986. Pp. liv, 446. \$39.50. ISBN 0-678-00038-7. JEL 87-0690

Reprint of the second edition is preceded by a discussion of Malthus's *Principles and the Classical Tradition* written by Morton Paglin in 1964. Text deals with topics such as the definition of wealth and productive labor; the nature, causes, and measures of value; the rent of land; the wages of labor; the profits on capital; the distinction between wealth and value; and the progress of wealth. Index.

MARX, KARL AND ENGELS, FREDERICK. *Karl Marx, Frederick Engels. Collected Works*. Volume 22. *Marx and Engels: 1870-71*. New York: International; London: Lawrence and Wishart; Moscow: Progress in collaboration with the Institute of Marxism-Leninism, Moscow, 1986. Pp. xxxiv, 785. \$15.00. ISBN 0-7178-0522-0. JEL 87-0691

Contains eighty-two works by Marx and Engels, seventeen published in English for the first time. Covers works written between the latter half of July 1870 and the end of October 1871. Includes most of their articles, statements, and letters to newspapers directly connected with their guidance of the International. Contains, among other items, the First and Second Addresses to the General Council of the International Working Men's Association on the Franco-Prussian War. "Notes on the War" covers the fifty-nine items by Engels on the Franco-Prussian War and published in *The Pall Mall Gazette*. Other items include *The Civil War in France*, a basic work on scientific communism; and documents, including speeches by both Marx and Engels at the 1871 London conference of the International. Various editorial corrections have been included, such as spelling, titles, and geographical descriptions. Name, subject, quoted and mentioned literature, and periodical indexes.

MARX, KARL AND ENGELS, FREDERICK. *Karl Marx, Frederick Engels. Collected Works*. Volume 28. *Karl Marx: 1857-61*. Translated by ERNST WANGERMANN. New York: International; London: Lawrence and Wishart; Moscow: Progress in collaboration with the Institute of Marxism-Leninism, Moscow, 1986. Pp. xxvii, 590. \$15.00. ISBN 0-7178-0628-X. JEL 87-0692

The first of two volumes covering Marx's economic works written during 1857-61. Presents Marx's economic manuscripts, written during 1857-58, representing a rough version of *Capital* and economic writings that immediately preceded it. This volume includes: "Bastiat and Carey" and the "Introduction" and preliminary installments of the *Outlines of the Critique of Political Economy (Grundrisse)*, including chapters on money and capital. Editorial changes are included, such as completing sentences of the original manuscripts, grammar, and incidental insertions. Name, quoted and mentioned literature, periodical, and subject indexes.

MUN, THOMAS. *England's treasure by foreign trade*. Reprints of Economic Classics series. Fairfield, N.J.: Kelley, [1664] 1986. Pp. viii, 88. \$15.00.

JEL 87-0693

A treatise to the Right Honorable Thomas, Earl of Southampton, High Treasurer of England, as a discourse on the importance of foreign trade by a seventeenth-century London merchant. Discusses topics such as the qualities required by a perfect merchant of foreign trade; the importance of foreign trade as the means for augmenting a nation's wealth; how to increase exports and decrease imports; the futility of trade prohibitions; the errors of debasing currency; the role of merchants in foreign trade; the role of bankers; how revenues can be increased; and how to examine balances of trade. Concludes that foreign trade is the source of revenue for the King, supplies wants, enhances employment, and becomes the "terror of our enemies." Supports policies to increase trade and protect it from foreign injuries. No index.

PETTY, SIR WILLIAM. *The economic writings of Sir William Petty, together with the observations upon the bills of mortality more probably by Captain John Graunt*. Two volumes in one. Edited by CHARLES HENRY HULL. Reprints of Economic Classics series. Fairfield, N.J.: Kelley, [1699] 1986. Pp. xci, 700. \$57.50. ISBN 0-678-00029-8.

JEL 87-0695

Collection of Petty's economic and statistical writings. Texts are those of best published edition, with original paging indicated. Some selections represent original authentic manuscripts. Notes are confined mainly to economic or biographical aspects of the topics being discussed. A lengthy introduction covers Petty's life from the perspective of events and their bearing on it. Bibliography of the printed writings of Petty, including a supplement. List of books and manuscripts used. The editor is at Cornell University. Index.

ROTHBARD, MURRAY N., ed. *The review of Austrian economics*. Volume 1. Lexington, Mass. and Toronto: Heath, Lexington Books, 1987. Pp. xiii, 246. \$30.00. ISBN 0-669-12892-9. JEL 87-0696

The first volume of a new annual series promoting the development and extension of Austrian economics and the analysis of contemporary issues in the mainstream of economics from an Austrian perspective. Defines Austrian economics as the body of theory founded by Carl Menger in his 1871 *Principles of Economics*. Current volume contains nine essays, two review essays, and five book reviews. Essays include: the inflationary chaos ahead; why subjectivism is emphasized by Austrians; von Mises approach to wages, prices, and employment, and his concern about the later neo-Keynesianism; a critique of monetarist and Austrian doctrines on the utility and value of money; the cases of Schumpeter and Hansen breaking out of the Walrasian Box; a review of two forgotten articles by von Mises on the rationality of Socialist economic calculation; conceptual problems and implications of rent seeking; Austrian perspectives on Keynesian fiscal policy and the recovery of the 1930s; and GNP, PPR (private product remaining with producers), and the standard of living. Rothbard is the S.J. Hall Distinguished Professor of Economics at the University of Nevada, Las Vegas. No index.

RYAN, CHRISTOPHER K. *Harry Gunnison Brown: Economist*. A Westview Special Study. Boulder, Colo. and London: Westview Press, 1987. Pp. xv, 179. \$23.50, paper. ISBN 0-8133-7355-7.

JEL 87-0697

Presents Brown's (1880-1975) career highlighting his views and contributions to economics. Sets the scene of Brown's earlier years by surveying views on land as a factor of production. Presents Brown's views on capital and interest theories. Reviews Brown's attitudes on Keynesianism, business cycles, monetarism, macroeconomic policies, and the Depression. Covers Brown's view of taxes on goods, labor, capital and profits, and land value taxation. Examines Brown's writings on railroad rates and public utility pricing, and international trade and finance. Comments on his professional career as an educator and writer of textbooks. Concludes with Brown's reaction to Marxist, institutionalist, and Georgist claims in political economy and an evaluation of his position in the profession. Ryan is an instructor of economics at Coe and Cornell Colleges. Index.

WEBB, SIDNEY. *Socialism in England*. Third edition. Aldershot, England and Brookfield, Vt.: Gower, [1890, 1893] 1987. Pp. lvi, 136. \$41.95. ISBN 0-566-05144-3. JEL 87-0698

Originally prepared at the request of the American Economic Association and first published in its series of monographs in 1889 to present an account of the development of Socialism. Begins with the development of the socialist ideal and the influence of Socialism in English public life. Describes the rise of the English socialist movement, the English socialist organizations and socialism in the churches and universities. Describes socialism in political economy, noting the evolution of socialist thought in economic literature. Concludes with a discussion of parliamentary and municipal socialism, giving numerous examples, and an examination of socialism in politics, reviewing demands of the English Socialist Party. Introduction to this edition by H. B. Acton (University of Edinburgh). Index.

#### 040 ECONOMIC HISTORY

BEREND, IVAN T. *The crisis zone of Europe: An interpretation of East-Central European history in the first half of the twentieth century*. Translated by ADRIENNE MAKAY-CHAMBERS. Cambridge, New York and Melbourne: Cambridge University Press, 1986. Pp. viii, 106. \$24.95. ISBN 0-521-32089-5. JEL 87-0699

Translation of the Hungarian edition of the author's Ellen McArthur Lectures delivered at Cambridge University in the autumn of 1984. The lectures consider the consequences of the disparity in modernization between Western Europe and East-Central Europe in the twentieth century and especially in the interwar years. A central theme is how the Central and Eastern European countries' feeling of being pushed to the periphery prepared the ground for the revolt against liberalism, the free-market economy, parliamentary democracy, and the rationalism of the Western world and took the form of the Bolshevik revolution, national revolutions, and right-wing radicalism. Specific topics include: the failures of economic, social, and national development; ideological-cultural revolution; different modes of social revolt after World War I; and the arts in the period of crisis and fascism. Berend is at Karl Marx University of Economics, Budapest. Index.

BROADBERRY, S. N. *The British economy between the wars: A macroeconomic survey*. Oxford and New York: Blackwell, 1986. Pp. 180. \$39.95. ISBN 0-631-15001-3. JEL 87-0700

Re-examines the experience of interwar Britain using the standard aggregate demand/aggregate supply framework of macroeconomics. Analyzes

the traditional themes of interwar economic history, integrating more recent quantitative research on the subject. Considers consumption, investment, exports and imports, money demand, wages, prices, employment, unemployment, government policy with regard to the exchange rate, tariffs, monetary policy, fiscal policy, and supply side measures. The general conclusion is that the United Kingdom was stuck in a position of unemployment equilibrium and the government could do little about it because of a lack of both international and domestic cooperation. Broadberry is a lecturer in economics at University College, Cardiff. Index.

CROUCH, DAVID. *The Beaumont twins: The roots and branches of power in the twelfth century*. Cambridge Studies in Medieval Life and Thought, Fourth Series. Cambridge; New York and Melbourne: Cambridge University Press, 1986. Pp. xxi, 242. \$39.50. ISBN 0-521-30215-3.

JEL 87-0701

A study of the wealth and power of the Beaumont twins—Waleran of Meulan and Robert of Leicester. Part 1 is a biographical account covering the period 1118-68 and dealing with the reign of Henry I, Stephen of Blois, and the association of the twins with Plantagenets and Capetians. Part 2 analyzes the sources of the twins' wealth and power and the causes of their effectiveness and their ineffectiveness at exercising power. Covers the honorial baronage, administration, revenues, and the church and the wider world. Bibliography; index.

DAVIS, LANCE E. AND HUTTENBACK, ROBERT A. *Mammon and the pursuit of Empire: The political economy of British imperialism, 1860-1912*. With the assistance of SUSAN GRAY DAVIS. Cambridge; New York and Melbourne: Cambridge University Press, 1986. Pp. x, 394. \$47.50. ISBN 0-521-23611-8.

JEL 87-0702

Economic and political history that uses cliometric research to study the profitability of the British empire in the five decades preceding World War I and identify the major players in the imperial game. Focuses on the effect of the imperial system on Britain, the role profits may have played in motivating political policies designed to continue and strengthen imperial ties, the rate of return on Empire investment, the flows of capital that underwrote those returns, the costs of maintaining or expanding the Empire, the groups that paid the costs, and those that reaped the economic benefits. Major findings are that probably at no time, and certainly not after the 1870s, were Empire profits sufficient to underwrite British prosperity and that the middle class bore far more than its share of the imperial subsidy and did not share

equally in the benefits/profits which accrued largely to the upper class. Davis is Mary Stillman Harkness Professor of Social Sciences, California Institute of Technology. Huttenback is Chancellor and Professor of History, University of California, Santa Barbara. Bibliography; index.

DICKMAN, HOWARD. *Industrial democracy in America: Ideological origins of national labor relations policy*. La Salle, Ill.: Open Court, 1987. Pp. xiii, 445. Paper. ISBN 0-8126-9008-7. JEL 87-0703

Presents a history of the ideas leading to labor relations policies of the 1930s and the present. Explains and reexamines the reasons put forth in favor of unionism to explain why collective bargaining became favored over individual bargaining and to account for the unique structure—majority rule unionism—in the United States. Discusses topics such as the rise of individualistic economic policy, the movement from criminal conspiracy to free association, labor's lack of power under competition, syndicalism, industrial democracy and socialism, the beginning of collective bargaining theory, the economy of high wages as an approach to industrial democracy, pluralist models of industrial democratic reform, and the promise of American life. Concludes with a discussion of American industrial democracy from 1933 to 1947, surveying the precedents for the Wagner Act, the debate over provisions of that law, and the Supreme Court interpretations of exclusive representation. Index.

ERICKSON, CHARLOTTE. *British industrialists: Steel and hosiery, 1850-1950*. Reprint. Aldershot, England and Brookfield, Vt.: Gower in association with the London School of Economics and Political Science, [1959] 1986. Pp. xxi, 276. \$54.00. ISBN 0-566-05141-9. JEL 87-0704

A historical study of the changes in the social origins and career patterns of approximately 631 men who headed firms in the British steel and hosiery industries for nearly a century (1865-1953). Inquiry for steel covers firms in England, Scotland, and Wales; whereas the Nottingham area was the focus for hosiery. Criteria for selection of personalities included active, managing partners, chairmen of limited companies, vice and deputy chairmen of limited companies, managing directors of limited companies, other executive directors, and general managers of large partnerships or sole proprietorships. Examines the social origins of the industries' leaders, referring to fathers' occupation, place of birth, education, marriage, peerages, age and length of service, and experiences. Also discusses the innovators and introducers of new techniques in these industries. Also analyzes the public company and its social origins and career patterns.

Erickson is Lecturer in Economics and History at the London School of Economics and Political Science. Names, companies, and general indexes.

- EVANS, RICHARD J. AND GEARY, DICK, eds. *The German unemployed: Experiences and consequences of mass unemployment from the Weimar Republic to the Third Reich*. New York: St. Martin's Press, 1987. Pp. xviii, 314. \$39.00. ISBN 0-312-00098-7. JEL 87-0705

Eleven original essays by British and German historians examine unemployment in the Weimar Republic. Papers address issues such as which groups were affected most severely, the effectiveness of welfare schemes, the impact on fueling social and political unrest, the role of unemployment in the collapse of the Republic and the rise of Hitler, and the attempt of the Nazis to solve the problem. The introduction presents a general survey of unemployment during the Weimar period, focusing on fluctuations in its rate, the groups affected, and the government's response, emphasizing social and political consequences. Subsequent papers address unemployment and demobilization after World War I; welfare and social insurance, 1918-27; unemployment insurance and compulsory labor, 1927-33; working women; youth unemployment and the state at the end of the Republic; social dislocation and political mobilization, 1929-33; unemployment and working class solidarity, 1929-33; and the Third Reich work-creation schemes. Evans is Professor of European History at the University of East Anglia. Geary is Senior Lecturer and Head of German Studies at the University of Lancaster. Index.

- GLYNN, SEAN AND BOOTH, ALAN, eds. *The road to full employment*. London; Winchester and North Sydney: Allen and Unwin, 1987. Pp. ix, 214. \$29.95, cloth; \$14.95, paper. ISBN 0-04-330361-7, pbk. JEL 87-0706

Thirteen essays explore the causes and consequences of the British interwar unemployment problem so as to shed light on contemporary problems. Seven essays in part 1 analyze the interwar unemployment problem in a multi-disciplinary manner, using economic, political, and social approaches. Six essays in Part 2 deal with policy issues, including Keynes's influence in the interwar years; treasury attitudes toward unemployment; the lack of emergence of a coherent industrial policy; the attitude of the Labour Party; reasons for policy failures; and the emergence of the government commitment to full employment during World War II. The contributors are mainly economists. Glynn is Senior Lecturer in Economic and Social History at the University of Kent. Booth is

Lecturer in Economic and Social History at the University of Sheffield. Bibliography; index.

- GOODHART, C. A. E. *The business of banking, 1891-1914*. Reprint. Aldershot, England and Brookfield, Vt.: Gower in association with the London School of Economics and Political Science, [1972] 1986. Pp. 628. \$63.00. ISBN 0-566-05142-7.

JEL 87-0707

Provides an analysis and description of the business of banking among the London joint stock banks, 1891-1914. Statistical records of banking behavior are reviewed in section 1, emphasizing three main sources of data—the annual and semi-annual balance sheets published by the banks, the monthly reports of the London joint stock banks, and the unpublished records of the banks. Also presents a critique of the accuracy of these data. Section 2 presents a description of the business of banking during the same period. Focuses on how the large London joint stock banks functioned within the context of the given structural setting, discussing aspects such as portfolio practices, determinants of the volume of deposits and liabilities, and changes in the volume of particular assets. The last section discusses the banking system and the gold standard, concluding that the classical analysis, which attributes a monetary explanation to the trade cycle and to the international adjustment, is not substantiated in the case of Great Britain. Goodhart has been a lecturer at Cambridge and the London School of Economics. Bibliography; bank and general indexes.

- HACKEN, RICHARD D., compiler. *Central European economic history from Waterloo to OPEC, 1815-1975: A bibliography*. Bibliographies and Indexes in Economics and Economic History series, no. 6. New York and London: Greenwood Press, 1987. Pp. xviii, 270. \$45.00. ISBN 0-313-25460-5.

JEL 87-0708

A bibliographic guide to the economic history of Central Europe. Restricted mainly to the German-speaking areas of Central Europe, but selectively covers mixed-language areas like Hungary, Bohemia, and Silesia. Contains more than 5,300 entries divided into five sections detailing the history of economic conditions, agriculture, industry, business and commerce, and finance. Each section is further subdivided geographically and chronologically. Hacken is European Studies bibliographer at Brigham Young University. Author index.

- HANDLIN, OSCAR AND HANDLIN, MARY FLUG. *Commonwealth: A study of the role of government in the American economy: Massachusetts, 1774-1861*. Reprint of the revised edition. Cambridge, Mass.

and London: Harvard University Press, Belknap Press, [1947] 1969. Pp. xvii, 314. \$20.00, cloth; \$8.95, paper. ISBN 0-674-14691-3, pbk.

JEL 87-0709

Concerned with the evolving picture of the relations between the system of government and production and the resulting institutional characteristics. Begins historical review with the inception of the state. Views the Revolution as an opportunity for the people to reconsider the nature of government and formulate a new set of assumptions on which they wished state government and the economy to rest. Examines the origins of the cooperation and the role of government before 1820, as well as up to the Civil War. Discusses the foundations of political power and its consolidation, behavior to encourage industry and commerce, the Commonwealth and corporations, the law of private rights, acquiescence as state policy, social disorganization and economic policy, liberal humanitarianism, and the reform state. The 1969 edition was thoroughly revised. Documentary appendices; index.

JONES, GEOFFREY. *Banking and empire in Iran: The history of the British Bank of the Middle East. Volume 1. Research by FRANCES BOSTOCK, GRIGORI GERENSTEIN, AND JUDITH NICHOL.* Hongkong Bank Group History Series. Cambridge; New York and Melbourne: Cambridge University Press, 1986. Pp. xxiv, 418. \$75.00. ISBN 0-521-32322-3.

JEL 87-0710

Business history of the British Bank of the Middle East and its role in both British overseas banking and banking in the Middle East. Volume 1 recounts the history of the Bank from its foundation as the Imperial Bank of Persia in 1889 through 1952, when its present name was adopted and it left its primary area of business, i.e., Iran. Discusses its activities and bankers from its beginnings through the two world wars up to the severance of British diplomatic relations with Iran in 1952. Sources include the Bank's archives as well as interviews with current and former members of the Bank's staff. Jones is Lecturer in Economic History, London School of Economics. Select Bibliography; index.

KUNZ, ANDREAS. *Civil servants and the politics of inflation in Germany, 1914-1924.* Veröffentlichungen der Historischen Kommission zu Berlin, Band 66. Beiträge zu Inflation und Wiederaufbau in Deutschland und Europa 1914-1924, Band 7. Berlin and New York: de Gruyter, 1986. Pp. xix, 427. \$54.50. ISBN 0-89925-222-2. JEL 87-0711

Argues that the economic and social impact of inflation from 1914-24 facilitated the entry of civil

servants into a modern type of interest politics which, in turn, increased the influence that civil service associations were able to exert on the conduct of economic and social policies in the early 1920s. Examines and documents the social history of German civil servants as a social group, during World War I and the postwar period of reconstruction that included the revolution of 1918-19 and the founding years of the Weimar Republic. The epilogue discusses the importance of these developments for Weimar democracy, the Nazi years, and collective bargaining and negotiating patterns in modern day German labor relations and policies. Kunz is with the Institute for Economic and Social History, Free University of Berlin. Bibliography; subjects, geographic names, and persons indexes.

LANGTON, JOHN AND MORRIS, R. J., eds. *Atlas of industrializing Britain, 1780-1914.* London and New York: Methuen, 1986. Pp. xxx, 246. \$27.00, cloth; \$14.95, paper. ISBN 0-416-30300-5, pbk.

JEL 87-0712

An atlas, including thirty-one descriptions and almost 400 maps tracing the economic, social, and political development of England between 1780 and 1914. Reviews trends and changes in the physical environment, population, regional structure, agriculture, rural settlements, wages, power, transport, trade, different industries that played important roles in England's economic development, services, wealth, poverty, urbanization, labor protest and unionization, sport, languages, popular institutions, education, religion, and the electoral system. The contributors are mainly economic historians, historians, and geographers. Langton is Fellow in Geography, St. John's College, University of Oxford. Morris is a member of the Department of Economic and Social History at the University of Edinburgh. Bibliography; no index.

[LASLETT, PETER] *The world we have gained: Histories of population and social structure. Essays presented to Peter Laslett on his seventieth birthday.* Edited by LLOYD BONFIELD, RICHARD M. SMITH, AND KEITH WRIGHTSON. Oxford and New York: Blackwell, 1986. Pp. x, 421. \$60.00. ISBN 0-631-13871-4. JEL 87-0713

Fifteen essays written by colleagues of Peter Laslett in recognition of his influence on social history and, in particular, his emphasis on connections between the past and present in national historiographies and historical sociology. Topics include: social structure in early modern and late nineteenth-century England; regional and local variations in European illegitimacy, family structure fecundity and the link between marriage and inheritance;

maternal mortality in preindustrial England and Western Europe; the nature of change in marriage, courtship, occupational structures in late medieval and early modern times; the social order of early modern England; welfare and the historians; and the genesis of experimental history. The contributors are mainly historians. Until he retired, Laslett was Reader in Politics and the History of Social Structure at Cambridge University. Index.

LESHY, JOHN D. *The mining law: A study in perpetual motion*. Washington, D.C.: Resources for the Future; distributed by Johns Hopkins University Press, Baltimore and London, 1987. Pp. xvi, 521. ISBN 0-915707-26-8. JEL 87-0714

Study of the origin, implementation, evolution, and future of the Mining Law of 1872. Notes the Law's longevity and how the original version differs from the modern mineral industry practices and contemporary land practices. Presents a history of the West, with mining law as its focus, including actors such as judges, governors, politicians, adventurers, and hustlers. Examines why the 114-year-old Law has survived. Argues that the Law has been reformed numerous times over the years by legislative amendment, executive implementation, and judicial interpretation. Also finds that various pressures for reform have tended to cancel out each other. Finds that efficient mineral development and environmental quality are not served well by the continued existence of the Law. Discusses origins of the Law, the Law itself, the decline of free access, the Law in operation, evolution of the law of discovery, current policy and application of the law of discovery, problems of scale, activities to protect the environment, problems of the wilderness, role of the executive and the courts in administering the Law, reforming the Law, leasing alternative, and prospects for change. Leshy is Professor of Law at Arizona State University College of Law. Name and subject indexes.

MACKENNEY, RICHARD. *Tradesmen and traders: The world of the guilds in Venice and Europe, c. 1250-c.1650*. Totowa, N.J.: Barnes & Noble Books, 1987. Pp. xvi, 299. \$29.95. ISBN 0-389-20701-2. JEL 87-0715

Examines guilds as the component units of medieval polity. Studies guilds over a period of four centuries in an attempt to reassess the importance of a generally neglected institution, especially in the context of its influence on the city of Venice. Revises accepted views on guilds of medieval times and early modern Europe. Each chapter contains a comparative essay which offers general ideas about the uniqueness of the Venetian guilds and the role of guilds in urban European life from the

13th to the 17th centuries. Uses cities such as Florence, London, Lyon, Antwerp, and Amsterdam for comparisons. Presents a broad perspective of guilds—their relationship to medieval policy, Christian brotherhood, enterprise, festive spirit and public life, the Counter-Reformation, and war. Mackenney is Lecturer in History at the University of Edinburgh. Bibliography; index.

[PENROSE, ERNEST F.] *Japan and world depression: Then and now. Essays in memory of E. F. Penrose*. Edited by RONALD DORE AND RADHA SINHA. With assistance from MARI SAKO. New York: St. Martin's Press, 1987. Pp. xxiv, 208. \$29.95. ISBN 0-312-44054-5. JEL 87-0716

Eleven essays honoring Ernest Penrose (1895-1984), who was a professor both in Japan and the United States and served both U.S. and international agencies. Selections compare the Japan of fifty years ago and today. The opening essay, "Memoirs of Japan, 1925-30," by Ernest Penrose reflects on Penrose's first teaching position at Nagoya College of Commerce. Other essays discuss depressions and protectionism, comparing the 1930s and 1980s; the major changes in the Japanese economy during the interwar period; Japanese public opinion and policies on defense and security; Britain's view of the Japanese economy in the 1930s; Soviet-Japanese relations; Japan's experience in China; and Japan's relationship with Thailand. Dore is Assistant Director of the Technical Change Centre in London and Visiting Professor at Imperial College, University of London. Sinha is Professor of Political Economy at the University of Glasgow. Name and subject indexes.

WALKER, DAVID W. *Kinship, business, and politics: The Martínez del Río family in Mexico, 1824-1867*. Institute of Latin American Studies, Latin American Monographs series, no. 70. Austin: University of Texas Press, 1986. Pp. x, 278. \$27.50. ISBN 0-292-74308-4. JEL 87-0717

Historical study of the trials and tribulations in the realms of business and politics of an important family in early national Mexico. Uses primary source materials, including private correspondence and business records of the family, public notary documents, transcripts of judicial proceedings, and archives of Mexico's Ministry of Foreign Relations and the British Foreign Office. Uses the family history to analyze problems relating to the development of the newly independent state and society in early nineteenth century Mexico. Finds that the processes of socioeconomic formation in Mexico differed from those in Western Europe and the United States, so that entrepreneurial activity had different implications for economic development

and class formation. Traces family life in Mexico, 1792-1860; the Martínez del Río family, 1830-60; and commerce, banking, textiles, and the tobacco debt bonds. Presents a historical perspective of kinship, business, and politics. Concludes with an epilogue on the Martínez del Río family, 1864-1984, indicating that by 1940, the family's economic resources were nearly exhausted. Walker is a visiting lecturer at Harvard University. Bibliography; index.

#### 050 ECONOMIC SYSTEMS

BUICK, ADAM AND CRUMP, JOHN. *State capitalism: The wages system under new management*. New York: St. Martin's Press, 1986. Pp. ix, 165. \$29.95. ISBN 0-312-75619-4. JEL 87-0718

Argues that capitalism is a worldwide system of commodity production based on wage labor and that the level of production throughout the world is determined by the need of productive enterprises to compete on the world market. Contends that it is impossible for capitalism and socialism to coexist. The substitution of state ownership for private ownership does not mean the abolishment of capitalism, but only that part of the capital has been incarnated by the state; therefore, even Russia and China are state capitalist rather than socialist countries. Examines state capitalism in its Western form of selective nationalization, particularly in Britain. Traces the origins of Russian state capitalism to the 1917 revolution and to the ideology of Vladimir Lenin. Presents an alternative to capitalism—a classless world society without exchange, where all goods and services would be produced for use only and would be distributed free directly to the people so that each person's needs are fully satisfied, with capital and land belonging to the people. Buick is a civil servant with the Commission of European Communities in Luxemburg. Crump is Lecturer in Politics at the University of York. Bibliography; index.

COMISSO, ELLEN AND TYSON, LAURA D'ANDREA, eds. *Power, purpose, and collective choice: Economic strategy in socialist states*. Cornell Studies in Political Economy series. Ithaca and London: Cornell University Press, 1986. Pp. 422. \$39.50, cloth; \$14.95, paper. ISBN 0-8014-9435-4, pbk. JEL 87-0719

Fourteen papers, most of which first appeared in the Spring 1986 issue of the journal *International Organization* (Vol. 40, no. 2), analyze the foreign economic strategies of the European members

(particularly Romania, Hungary, East Germany, and Poland) of the CMEA. Focuses on the connection between economic policy choices and the way in which political elites that make the choices stay in power. Specific topics include: state structures, political processes, and collective choice in CMEA states; the debt crisis and adjustment responses in Eastern Europe; the political economy of the CMEA; the historical evolution of Eastern Europe; economic strategy of specific CMEA states; and comparison of adjustment responses to international economic disturbances between CMEA members and Yugoslavia and East Asian, Latin American, and Mediterranean Basin NICs. The concluding paper compares state structures and political processes within and outside the CMEA. The contributors are mainly economists and political scientists. Comisso is Associate Professor of Political Science, University of California, San Diego. Tyson is Associate Professor of Economics, University of California, Berkeley. No index.

DOWDY, EDWIN, ed. *Marxist policies today: In socialist and capitalist countries*. St. Lucia, Queensland: London and New York: University of Queensland Press, 1986. Pp. viii, 234. \$34.50. ISBN 0-7022-1927-4. JEL 87-0720

Ten essays by contributors from Australia, Europe, and North America focus on the usefulness of Marxist ideas and methods in dealing with matters of practical policy. The majority of the papers were given at a 1983 seminar at the University of Queensland marking the hundredth anniversary of the death of Karl Marx. Essays discuss Marxist analysis of capitalism in Australia, the legacy of Marx in the West German trade union movement, policy formation and Marxist reformism, the rise and fall of Marxist ideology in communist countries, Chinese Marxist thinking since 1978, Marxian law of value under Socialism, Marxism and education, Marxism and feminism, and class, hegemony, and the state in recent Marxist approaches to the sociology of sport. Approach is multidisciplinary. Dowdy is Associate Professor of Sociology at the University of Queensland. Index.

ENGLIS, KAREL. *An essay on economic systems: A teleological approach*. Translated by Ivo MORA-VCIK. East European Monographs, no. CCI. Boulder, Colo.: East European Monographs and Czechoslovak Society of Arts and Sciences; distributed by Columbia University Press, New York, [1946] 1986. Pp. xxviii, 153. \$30.00. ISBN 0-88033-085-3. JEL 87-0721

Translation from the Czechoslovak of Englis's *Economic Systems* (1946) with a new introduction. Presents a theoretical analysis of the relationship

between socio-political frameworks and economic doctrines, and their implications for economic policy and specific economic developments. Concerned with a specific stage of economic development in which a modern political state has attained maturity and assumed the function of regulating the nation's economic problems. Begins with a discussion of the polarity of economic systems—spanning the range from individualism to solidarism. Describes the capitalist and cooperative systems and the solidarist economy. Discusses elements of economic systems, mixed systems, economic systems and ethics, the moral nature of mankind, legal order, theory of the state, controlled economies, transformation of capitalism, economic systems and international trade, the formal political structure of the state, planned economics and socialism, and international solidarism. Finds a role for both individualism and solidarism, the former to stimulate progress through competition and the latter to implement the former to eliminate poverty and provide for a balanced development. The late Karel Englis was Professor of Economics and University Rector at Charles University in Prague. Bibliography of Englis's writings. No index.

GOODALL, FRANCIS. *A bibliography of British business histories*. With an introduction by GEOFFREY JONES ET AL. Aldershot, England; Brookfield, Vt.; Hong Kong and Sydney: Gower, 1987. Pp. 638. \$95.00. ISBN 0-566-05307-1. JEL 87-0722

An introduction describing business history, its nature, new directions, and methodology is followed by a user's guide, a standard industrial classification scheme, bibliographies, libraries and abbreviations. Major portion of volume consists of an author index followed by a company index and an industrial classification index. The bibliography contains a range of materials relating to U.K. companies of the past and current centuries, including some based in England but operating mainly overseas, and foreign firms based in Britain. The author index is arranged alphabetically and includes author's name, title citation, comment about contents such as pages and illustrations, SIC classification, firm, and source library. Author index also includes cross reference SICs. The company index lists companies by name and the SIC index brings together all companies in the same industry. Goodall was associated with the London School of Economics at the time this volume was prepared.

HAUPT, GEORGES. *Aspects of international socialism, 1871-1914. Essays by Georges Haupt*. Translated by PETER FAWCETT. With a preface by ERIC HOSBAWM. Studies in Modern Capitalism series. Cambridge; New York and Melbourne: Cambridge

University Press; Paris: Éditions de la Maison des Science de l'Homme, 1986. Pp. xvii, 181. \$37.50. ISBN 0-521-26259-3. JEL 87-0723

Translation of six papers by the historian Georges Haupt (1928-78). Originally published between 1966 and 1978, the papers examine various aspects of the history of European socialism (especially during the period of the Second International) and revolutionary ideology. Major themes are: the groups of labor and socialist party leaders and activists and their ideas; the structure and development of socialist ideology and its evolution in theoretical and political debate; and the interaction between theory, doctrine, and program as historical reality changed. Specific topics are: from Marx to Marxism; the commune as symbol and example; the role and influence of German social democracy in Southeast Europe; international leading groups in the working class movement; Lenin, the Bolsheviks, and the Second International; and Lenin's views on war and revolution. Index.

HIBBS, DOUGLAS A., JR. *The political economy of industrial democracies*. Cambridge, Mass. and London: Harvard University Press, 1987. Pp. viii, 327. \$37.50. ISBN 0-674-68580-6. JEL 87-0724

Eleven articles published between 1976 and 1982 examine the political economy of industrial democracies. Part 1 deals with industrial conflict, its fluctuations, trends, and consequences, focusing on strike activity in capitalist democracies. Part 2 analyzes politics and economics in the United States and the behavior of political authorities in response to the economic demands to reduce inflation. The last part deals with comparative and European politics and economics, citing examples from the United States, United Kingdom, West Germany, France, and Sweden. These studies attempt to assess voter sensitivity to real economic performance in relation to their sensitivity to nominal economic performance. Hibbs is at the Nationalekonomiska Institutionen, Göteborg University, Sweden. Index.

IOFFE, OLIMPIAD S. AND JANIS, MARK W., eds. *Soviet law and economy*. University of Leyden, Documentation Office for East European Law, Law in Eastern Europe series, no. 32. Norwell, Mass.; Dordrecht and Lancaster: Kluwer Academic, Martinus Nijhoff, 1986. Pp. xii, 335. \$74.00. ISBN 90-247-3265-4. JEL 87-0725

Fourteen papers examine Soviet law and economy, pinpointing controversy and disagreement. Addresses questions such as whether recent changes in the legal regulation of the Soviet economy signal a move toward economic decentraliza-

tion or are merely cosmetic modifications. The role of law in the Soviet Union, and the effect of Marxist-Lenin ideology on contemporary Soviet law and economy are also addressed. Papers are divided into three parts covering: (1) centralized planning, the subordinate role of economic contracts, the separation of production from ownership, and the possibilities and limits of Soviet economic reform; (2) labor law, women in the Soviet economy, personal property and its legal implications, legal regulations regarding the dissemination of scientific and technical information, copyrights and trademarks, crime, and comrades' courts and labor discipline; and (3) Soviet theory of international law, economic, political, and legal aspects of Soviet foreign trade, COMECON and economic law, Polish economic law, and Soviet law and foreign scholarship. Ioffe is Professor of Comparative Law, and Janis is Professor of International Law, both at the University of Connecticut School of Law. Index.

MANNAN, MUHAMMAD ABDUL. *Islamic Economics: Theory and practice (Foundations of Islamic Economics)*. Revised edition. Sevenoaks, Kent, England: Hodder and Stoughton for the Islamic Academy, Cambridge, England; distributed by Westview Press, Boulder, Colo., [1970] 1986. Pp. xvi, 425. \$26.50, paper. ISBN 0-8133-0479-2.

JEL 87-0726

Revised and updated edition of a book that has been reprinted over twelve times since 1970. Presents Islamic economic values within the context of contemporary economic analysis with special reference to the economic problems of Pakistan in light of its commitment to welfare state concepts based on Islamic ideology. Assumes no prior knowledge of either economics or Islamic thought. Changes in the new edition include the addition of a new chapter that critiques the operations of the Islamic Development Bank and other banks along with policy suggestions, an additional introductory chapter dealing with pertinent methodological issues, and end-of-chapter lists for further reading. Examines Islamic Economic Laws, consumption and consumer behavior, factors of production and the concept of ownership, problems and issues in factors of production, distribution of income and wealth, price theory, interest-free banking in Islam, Islamic banks and investment companies, consumption and nonconsumption loans, fiscal policy and budgeting, public finance, trade and commerce, cooperative insurance, Islamic and other economic systems, social order, and planning and development. Mannan is Professor, Islamic Research and Training Institute, Islamic Development Bank, Jeddah, Saudi Arabia. Index.

NOLAN, PETER AND PAINE, SUZANNE, eds. *Rethinking socialist economics: A new agenda for Britain*. New York: St. Martin's Press, 1986. Pp. viii, 373. \$37.50. ISBN 0-312-67806-1. JEL 87-0727

Twenty-one articles presented at a conference at Jesus College, Cambridge University, and organized by the *Cambridge Journal of Economics* entitled "Towards New Foundations for Socialist Policies in Britain." Papers present recent developments in critical analysis of socialist political-economic principles and policies with the common conviction that it is possible to construct a participatory democratic society with efficiently working economic institutions, which is based neither on the unfettered free market nor on comprehensive state administration but on market-socialist principles. Topics discussed are: freedom and the state (3 papers); planning and markets (2 papers); the international setting (3 papers); macroeconomic policy (2 papers); industrial, financial, and regional policy (3 papers); the structure of work and welfare (4 papers); income distribution, wages, and policies (3 papers); and what a socialist planned economy in Britain would be like (postscript). The contributors are mainly economists. Nolan is Lecturer, Faculty of Economics and Politics, University of Cambridge and Fellow of Jesus College, Cambridge. The late Suzanne Paine was Lecturer, Faculty of Economics and Politics, University of Cambridge and Fellow of Clare College. No index.

SENDER, JOHN AND SMITH, SHEILA. *The development of capitalism in Africa*. London and New York: Methuen, 1986. Pp. xi, 177. \$33.00, cloth; \$16.95, paper. ISBN 0-416-37740-8, pbk. JEL 87-0728

Focuses on the identification and analysis of social and economic change in sub-Saharan Africa. Main attention is given to internal changes, particularly changes in social relations of production. Analyzes the impact of trade with advanced capitalist countries during the colonial period on the growth of the domestic market in Africa. Examines the process whereby a free market for wage labor developed in colonial Africa. Discusses the links between state intervention, successful import-substituting industrialization and export growth, and the potential and positive effects of state intervention in post-colonial Africa. Provides an account of the reasons for the economic stagnation and regression in certain African countries. Generalizations are based on a review of data and research for Ethiopia, Ghana, Ivory Coast, Kenya, Malawi, Mozambique, Nigeria, Senegal, Tanzania, Zambia, and Zimbabwe. Sender is Assistant Director of Development Studies, University of Cambridge. Smith is Lecturer in Economics at the University of Sussex. Bibliography; index.

## 100 Economic Growth; Development; Planning; Fluctuations

### 110 ECONOMIC GROWTH; DEVELOPMENT; AND PLANNING THEORY AND POLICY

BOSERUP, ESTER. *Woman's role in economic development*. Second edition. Aldershot, England and Brookfield, Vt.: Gower in association with the London School of Economics and Political Science, [1970] 1986. Pp. 283. \$41.95. ISBN 0-566-05139-7. JEL 87-0729

Examines the difference in work conditions between the sexes in countries that are in the process of economic development. Second edition contains a new preface. [See JEL no. 71-0382 for annotation of the first edition. For review see JEL, Volume 10, issue no. 2 (June 1972) pp. 463-4.] Argues that, during this process, the need arises for better education and training not only of men, but also of women, if the society is to function efficiently. Considers differences in the village (male and female farming systems, the economics of polygamy, loss of status under European rule, and the casual worker); in the town (market trade and services, industry, education, and women in the urban hierarchy); and from village to town (lure of the towns, urban job opportunities for women, the fear of unemployment, and the design of female education). Contains statistical tables on the occupational distribution of the female labor force in the 1950s and 1960s for various countries in Sub-Saharan Africa, the region of Arab influence, South and East Asia, and Latin America. Author and subject indexes.

DENOON, DAVID B. H., ed. *Constraints on strategy: The economics of Western security*. Washington, D.C.; London; Beijing and Toronto: Pergamon-Brassey's, 1986. Pp. x, 284. ISBN 0-08-033139-4. JEL 87-0730

Six essays review American alliances from the perspective of defense policy and strategy. Papers analyze the relationship between defense policy and the economics of key Western alliance partners: the United States, United Kingdom, France, the Federal Republic of Germany, Spain, Portugal, Greece, Turkey, Japan, and South Korea. Addresses three broad issues: what will be the likely economic performance for the United States and its principal allies in the next three to five years? What useful generalizations can be made about the relationship between economic performance

and defense spending in these countries? How will economic factors shape defense options during the current decade? Topics discussed include the nature of the U.S. dilemma, military debates, alliance problems, the varying approaches of different alliance members, the impact of increasing defense expenditures on the U.S. economy, defense burdens for the European allies (both Northern and Southern tiers), and the situation in Japan and South Korea. Concluding essay by Denoon discusses economic constraints and U.S. defense policy in the 1980s. The contributors, besides the editor, are Kevin Forbes, David Galenson, Walter Galenson, George Korsun, Martin McGuire, James Murdoch, M.I. Nadiri, and Todd Sandler. Denoon is an Associate Professor of Politics and Economics at New York University. Bibliography; index.

FALTAS, S. *Arms markets and armament policy: The changing structure of naval industries in Western Europe*. Studies in Industrial Organization series, vol. 7. Norwell, Mass.; Dordrecht and Lancaster: Kluwer Academic, Martinus Nijhoff, 1986. Pp. 417 \$69.00. ISBN 90-247-3406-1. JEL 87-0731

An investigation of naval industries (shipbuilders and warship equipment makers) in NATO Europe between 1960 and 1980. Traces the development of this part of the defense industry in the region, the markets on which it relies, trends toward expansion in developing countries, its industrial organization, and the effects of technological change on the industry. Chapters focus on changing navies and naval technology, the internationalization of the warship building and warship equipment industries, concentration and specialization in naval industries and rationalization in European NATO armaments. Concludes that the naval industries are rapidly orienting themselves toward the world market. Study was submitted and approved as a doctoral dissertation at the Free University, Amsterdam. Faltas is with the Technische Hogeschool Eindhoven, the Netherlands. No index.

GHARAJEDAGHI, JAMSHID. *A prologue to national development planning*. In collaboration with RUSSELL L. ACKOFF. Contributions in Economics and Economic History series, no. 70. New York and London: Greenwood Press, 1986. Pp. xiii, 210. \$35.00. ISBN 0-313-25285-8. JEL 87-0732

Focuses on philosophical, methodological, and conceptual aspects of national development planning; advocates interactive planning. Discusses deficiencies that arise from misconceptions of nation, development, and planning. Presents the interactive planning framework, phases, and process, and considers social learning and development, the role

of government, and the design of participative systems. Identifies obstructions to development and shows how they can be converted into opportunities. Examines the intersection of each of three primary obstructions to development (scarcity, maldistribution, and insecurity) with each of five ideal pursuits deemed necessary for development (truth, plenty, good, beauty, and power) and the obstructions produced at each intersection. The concluding chapter proposes that the planner's function is to inspire the planning of change. Gharaiedaghi is President of Interact, The Institute for Interactive Management in Philadelphia. Ackoff is Chairman of the Board of Interact and Emeritus Professor of Management Sciences, University of Pennsylvania. Bibliography; index.

GHOSH, RANEN. *Quantitative economic models for developing countries*. Calcutta: Ranitra Books, 1986. Pp. viii, 224. \$8.00, paper. JEL 87-0733

Twenty papers that represent author's research over the past ten years, some of which have been published previously. Focus is on understanding the economic phenomena of developing countries. Essays are mainly quantitative and econometric in nature, written from the perspective that economic phenomena should dictate the choice of analytical tools. Makes special reference to the economies of India, Ghana, Nigeria, and Zambia. Specific topics include the agricultural production function, the relationship between concepts and quantification, techniques of analyzing economic variable data, inflation and economic growth, qualitative variables in quantitative economic models, *modus operandi* of a developing economy, economic development with controlled inflation, impacts of the first three Five Year Plans on the structure of the Indian economy, input-output analysis and economic development plans, Gandian ideas as panacea for the unemployment problem, economic developmental programs and the public sector, the nature of the investment variable, a dummy variables model for analyzing seasonality of economic variables, and Bayesian econometrics. The author is an econometrician, currently engaged in research on Development Economics. Index.

KALECKI, MICHAŁ. *Selected essays on economic planning*. Edited, translated, and introduced by JAN TOROŃSKI. Cambridge; New York and Melbourne: Cambridge University Press, 1986. Pp. vi, 123. \$34.50. ISBN 0-521-30637-2.

JEL 87-0734

Eleven translated and edited essays on economic planning written and previously published (mostly in Polish journals) by Michał Kalecki between 1940

and the 1960s. Topics of essays are: the essentials for democratic planning, workers' councils and central planning, the vertically integrated firm as an element in the new economic model, an outline of a new system of incentives and directives, central price determination as an essential feature of a socialist economy, labor productivity, the basic principles of long-term planning, problems in the theory of growth of a socialist economy, the influence of the construction period on the relationship between investment and national income, and the coefficient of capital tied up in construction. The editor is an economist at Standard Chartered Bank, London. Index.

KITCHEN, RICHARD L. *Finance for the developing countries*. Wiley Series on Public Administration in Developing Countries. Chichester; New York; Toronto and Singapore: Wiley, 1986. Pp. xvii, 365. \$57.00. ISBN 0-471-90945-9. JEL 87-0735

Presents basic concepts and practices of development financing for developing countries at both the macro and micro levels; focuses on financial instruments as well as the institutions and markets that mobilize them. Considers: basic principles, financial processes, and mechanisms of development finance; capital market theory and developing countries; the impact of the domestic financial system on economic development; mobilization of domestic finance through the actions of government, formal and informal financial institutions, and securities markets; external financing with reference to public sector flows, export credits, private sector flows, debt, adjustment, and the IMF; the financing of capital investments; and recent proposals to improve the quantity and quality of development financing. Kitchen is a lecturer at the Project Planning Centre for Developing Countries at the University of Bradford. Author and subject indexes.

SHEPHERD, WILLIAM G. *The ultimate deterrent: Foundations of US-USSR security under stable competition*. In association with THEODORA B. SHEPHERD. New York and London: Greenwood Press, Praeger, 1986. Pp. x, 137. \$29.95. ISBN 0-275-92368-1. JEL 87-0736

Argues that the United States and Union of Soviet Socialist Republics are inherently secure from conquest by the other, regardless of any military defense of their homelands, because neither can gain by taking over and exploiting the other and the process of global competition between the two countries is a stable one. Further arguments are that the threat of world domination by either country is imaginary and that weapons capable of mutual destruction contribute nothing to the already

existing freedom from conquest and plunder. Discusses the logic of inherent superpower security, conditions that make the U.S. inherently secure, counterarguments, stability of superpower competition as the basis for coexistence, historical cases supporting the argument, the main benefits and costs of conquest, use of the national wealth for military spending and residual interests, and lessons for both superpowers. William G. Shepherd is Professor of Economics, University of Massachusetts, Amherst. Theodora B. Shepherd is a research specialist in economic history. Bibliography; index.

[STREETEN, PAUL] *Theory and reality in development: Essays in honour of Paul Streeten*. Edited by SANJAYA LALL AND FRANCES STEWART. New York: St. Martin's Press, 1986. Pp. xii, 291. \$29.95. ISBN 0-312-79726-5. JEL 87-0737

Fourteen papers written by former students or colleagues of Paul Streeten, who is currently Director of the World Development Institute at Boston University, in honor of his many contributions to development economics, his role in the basic needs movement in development economics, and his emphasis on the importance of understanding economic behavior in its social and political context. Topics include: Adam Smith's treatment of prudence, stagflation and the third world, a proposal for an IMF debt refinancing subsidiary, alternative approaches to North-South negotiations, a welfare-theoretic analysis of extending free trade to include international investment, the third world and comparative advantage in trade in services, the early 1980s in Latin America, communal land tenure systems and their role in rural development, world food security, and East-South trade. Many of the contributors are economists. Lall is Senior Research Officer, Institute of Economics and Statistics and a Fellow of Green College, Oxford University. Stewart is Senior Research Officer, Institute of Commonwealth Studies and Fellow of Somerville College, Oxford University. Index.

WEIDA, WILLIAM J. AND GERTCHER, FRANK L. *The political economy of national defense*. Boulder, Colo. and London: Westview Press, 1987. Pp. xvii, 230. \$36.00. ISBN 0-8133-0432-6. JEL 87-0738

Covers both the economic and political aspects of defense spending. Provides a theoretical framework and explains, in a political economy context, the results of decisions to allocate scarce resources to defense. Discusses possible alterations to the U.S. defense establishment structures that would permit more efficient solutions. Describes the na-

tional security objectives, discusses defense, procurement and budget processes, and the politics of national defense spending, using the MX missile as a case study. Analyzes the economics of production, distribution, and defense, evaluating alternative economic systems approaches and describing types of market failures. Examines the defense budget; regional defense spending; the defense industrial base; efficient production of weapon systems; cost factors; efficiency issues; and international aspects such as burden sharing and security assistance. The final part examines the political economy of the program and presents solutions to resource allocation problems. Weida is Associate Professor at the Colorado College, Colorado Springs. Gertcher is Senior Research Specialist at R&D Associates, Colorado Springs. Bibliography; index.

WOOD-RITSATAKIS, A. *Unified social planning in the Greek context*. Centre of Planning and Economic Research Studies series, no. 23. Athens: Centre of Planning and Economic Research, 1986. Pp. xiii, 169. Paper. JEL 87-0739

Examines the nature of development planning, its rationale, problems, and techniques. Proposes an approach to planning that integrates both economic and social considerations, recognizing social justice as its aim. Examines development planning in Greece from this perspective, particularly the 1968-72 Development Plan. After a discussion of the nature of planning, including a brief history, reasons for its existence, methods for evaluation, decision making, and planning techniques, the author describes unified planning and the development of social indicators. Summarizes the Greek experience with development planning, reviewing the economic and administrative background for the 1968-72 plan. Examines aims of that plan and measures designed to attain them. Develops a set of social indicators to assess the plan's achievements with regard to education, health, social welfare, housing, industry and agriculture, and the aging, women, and regional population groups. Concludes that the plan in Greece did not recognize multisectoral objectives, emphasized productivity growth instead of people's needs, and did not include popular participation. For the future, suggests that there is a need for a clearer definition of goals and objectives at all levels. Author's Ph.D. dissertation accepted by the University of Manchester (1984). Bibliography; no index.

## 120 COUNTRY STUDIES

**BANK OF ISRAEL.** *Bank of Israel Annual Report 1985: Presented to the Government and the Finance Committee of the Knesset in accordance with Section 59 of the Bank of Israel Law, 5714-1954.* Jerusalem: Author, 1986. Pp. ix, 227. Paper. ISSN 0067-635X. JEL 87-0740

English edition is an abridged version of the original Hebrew Report. Based on material prepared and analyzed by the Bank's research department and data supplied by the Central Bureau of Statistics. Reviews the economy in general, emphasizing developments under the "package deals"—tripartite price-wage agreements between the government, Histadrut (Trade Union Federation), and the employers' organization. Credits these deals with slowing inflation from 23 percent monthly to 4-5 percent. Reviews the main features of the economic stabilization program, discussing the budget, exchange rates, taxation, wages, prices, monetary policy, and the capital markets. Other chapters deal with product and domestic demand, disposable income, and private consumption and saving; prices, employment, and wages; the public sector; the principal economic sectors such as agriculture, industry, construction, transport and communications, tourism, and energy; the balance of payments, including its financing and the foreign debt; money and capital markets; and activities of the Bank of Israel. No index.

**BOSWORTH, BARRY P. AND RIVLIN, ALICE M., eds.** *The Swedish economy.* Washington, D.C.: Brookings Institution, 1987. Pp. xvi, 338. Paper. ISBN 0-8157-1041-0. JEL 87-0741

Seven papers and commentaries resulting from a conference held at Skokloster, Sweden, in June 1986 examine the Swedish economy and its response to slower economic growth, currency devaluation, and attempts to decrease the budget deficit. Papers identify apparent strengths and weaknesses of the Swedish economic situation and the major economic choices facing Sweden at the end of the 1980s. Alice Rivlin provides an overview of the Swedish economy. Three papers, all by Barry P. Bosworth and Robert Z. Lawrence, consider how the domestic economy and the external sector are adjusting to slower economic growth and discuss existing macroeconomic policies and the current policy debate. Other topics are: efficiency and equality in Swedish labor markets (Robert J. Flanagan); taxes, transfers, and the Swedish labor supply (Gary Burtless); rethinking the role of the public sector (Edward M. Gramlich); and the political foundations of Swedish economic policy (R. Kent Weaver). Bosworth is Senior Fellow, Brook-

ings Economic Studies program, and Rivlin is Director of the program. Index.

**CHR. MICHELSEN INSTITUTE, DEPARTMENT OF SOCIAL SCIENCE AND DEVELOPMENT, DEVELOPMENT RESEARCH AND ACTION PROGRAMME.** *Bangladesh: Country study and Norwegian aid review.* Fantoft, Norway: Author, 1986. Pp. xxxiii, 353. Paper. ISBN 82-80584-08-3. JEL 87-0742

Report of a study of development aid to Bangladesh commissioned by the Norwegian Ministry of Development Cooperation. Part 1 deals with the political, social, and economic environment in which development aid operates and reviews Bangladesh's economy, population, and institutions. Part 2 outlines the overall nature of development assistance and the structure of and trends in Norway's aid to Bangladesh. Annexes outline the structure of the rural society, the agriculture and manufacturing sector, primary health care and family planning facilities, and aid to Bangladesh. Ole David Koht Norbye, coordinator of this study, is associated with the Chr. Michelsen Institute, Bergen. Bibliography; no index.

**DACY, DOUGLAS C.** *Foreign aid, war, and economic development: South Vietnam, 1955-1975.* Cambridge, New York and Sydney: Cambridge University Press, 1986. Pp. xix, 300. ISBN 0-521-30327-3. JEL 87-0743

Assessment of the relationship between the Vietnam War, foreign aid, and economic development in South Vietnam. Presents an economic survey of the Vietnamese economy; examines the goals and programming of U.S. aid; and analyzes the rate and pattern of growth and changes in indicators of economic development. Reviews the roles of land reform and income distribution and of domestic saving and foreign aid in economic development. Examines trends in, and causes of, wartime inflation and the nature of windfall gains from importing. Analyzes changes in the international value of the piaster, the nature of foreign assistance, sources of finance for public expenditures, and the fiscal dilemma in the Vietnamese economy. Evaluates the possibility of economic development in an environment of high military threat. Dacy is Professor of Economics at the University of Texas at Austin. Index.

**DIETZ, JAMES L.** *Economic history of Puerto Rico: Institutional change and capitalist development.* Princeton, N.J.: Princeton University Press, 1986. Pp. xxiii, 337. \$65.00, cloth; \$20.00, paper. ISBN 0-691-07716-9. JEL 87-0744

Focuses on the economic forces underlying the process of economic and social transformation in

the economy, arguing that the island's history is a connected ensemble of process, rather than a series of discrete events. Divides the history into five time spans: the period of Spanish colonialism; the early period of U.S. control, 1898-1930; the crisis and transformation of the 1930s; origins of industrialization, from state capitalism to Operation Bootstrap; and growth and misdevelopment from the 1950s to the present. Emphasizes how Puerto Rico has interacted with the world economy, living conditions of the workers, and the role of female workers. Notes that external capital interests are continuing to shape the characteristics of the economy. Also criticizes slighting agriculture in the development strategy. Presents a conclusion for other developing nations that economic "growth may occur for some, as in Puerto Rico in the past, but the price to be paid is high: an inappropriate and disarticulated structure of production." Dietz is Professor of Economics and Latin American Studies at California State University, Fullerton. Bibliography; index.

EUROPA PUBLICATIONS. *The Middle East and North Africa*, 1987. Thirty-third edition. London; Collaroy, New South Wales, Australia; New Delhi and Tokyo: Author; distributed in America by Gale Research, Detroit, 1986. Pp. xix, 911. \$135.00. ISBN 0-946653-22-4. JEL 87-0745

Thirty-third annual up-dated guide to the Middle East and North Africa. Part 1 is a general survey of the region and contains fifteen essays and/or sections. Essay topics include religions, the Arab-Israeli confrontation, the Jerusalem issue, oil, natural gas, Islamic politics, arms trade, and Islamic banking and finance. Other sections pertain to documents on Palestine; Palestine organizations; the Suez Canal; calendars, time, and weights and measures; research institutes; and select bibliography. Part 2 provides information on regional organizations. Part 3 consists of twenty-four country surveys including information on physical and social geography, history, the economy, and statistics. Each survey also contains a bibliography and country directory which provides information on laws and government, political organizations and leaders, diplomatic representation, religion, the press, publishers, radio and television, finance, trade and industry, transport, tourism, atomic energy, defense, and education. No index.

JERVE, ALF MORTEN, ed. *Pakistan: Country study and Norwegian aid review*. Fantoft, Norway: Chr. Michelsen Institute, Department of Social Science and Development, Development Research and Action Programme, 1985. Pp. xvii, 414. Paper. ISBN 82-90584-04-0. JEL 87-0746

A study commissioned by the Norwegian Department of Development Cooperation evaluates Norwegian development aid to Pakistan. Part of the report analyzes the political, economic, and social environment within which development assistance operates. Part 2 reviews the Norwegian aid experience in Pakistan, assesses the possibility of realizing Norwegian aid principles, and presents recommendations for a reorientation of Norwegian aid. Annexes present individual background papers on selected development issues and sectoral assessments. The authors are: Karin Ask, Per Tobiesen Aart van de Laar, Rodney Åsberg, Bård A. Andreassen, Armino Mirando, Ijaz Nabi, To. Skålne, Hugo Stokke, and the editor. Alf Morten Jerve is a Research Fellow at the Chr. Michelsen Institute, Bergen, Norway. Bibliography; no index.

JOHANSEN, HANS CHRISTIAN. *The Danish economy in the twentieth century*. New York: St. Martin's Press, 1987. Pp. 221. \$35.00. ISBN 0-312-00373-0. JEL 87-0747

Analysis of the evolution of the Danish economy during the period 1920-80. Outlines the trend and developments during the nineteenth century, and the state of the economy in 1920. Presents the trends in economic and social development over the entire period and reviews the change that occurred during the 1920s, the depression war and occupation, the changeover to peacetime, the balance-of-payments crisis due to external shocks, the evolution of the welfare state, and the problems and divisions that surfaced after 1973. Assesses the developments of these sixty years and examines certain proposed policies for dealing with the balance-of-payments disequilibria. Johansen is Professor of Economic History at the University of Odense, Denmark. Bibliography; index.

MESA-LAGO, CARMELO, ed. *Cuban studies*. Volume 16. Pittsburgh: University of Pittsburgh, Center for Latin American Studies, 1986. Pp. x, 297. \$24.95. ISBN 0-8229-3540-6. JEL 87-0748

Inaugural edition of an annual series, which is the transformation of the journal, *Cuban Studies. Estudios Cubanos*, into an annual hardcover publication. Contains nine interdisciplinary articles, a debate section, book reviews, and a classified listing of recent work in Cuban studies. The first section, (prepared under the guest editorship of Enrico Mario Santi) consists of seven papers on aspects of the emergence of Cuban national identity six of which were originally presented at a symposium held at Cornell University in April 1985. Two papers examine new trends in the Cuban economy, focusing on state enterprises under the new system of planning and management and

the economics of Cuban joint ventures. Two other articles debate the role of "Cubanology." The contributors are Latin American specialists. Mesa-Lago is Distinguished Service Professor, Department of Economics, University of Pittsburgh. No index.

MINAMI, RYŌSHIN. *The economic development of Japan: A quantitative study*. Translated by RALPH THOMPSON AND RYOSHI MINAMI with assistance from DAVID MERRIMAN. Studies in the Modern Japanese Economy series. New York: St. Martin's Press, 1986. Pp. xxvi, 487. \$37.50. ISBN 0-312-22876-7. JEL 87-0749

Translated (with some changes) from the Japanese edition, *Nihon no Keizai hatten* (1981). Changes include a new introductory section; inclusion of reviews of the Japanese edition; a new section on industrial organization and policies; updated tables, figures, and text; reliance on mainly English language sources; and exclusion of sources in Japanese found in the original edition. Analyzes the last hundred years of economic development in Japan. Focuses on the reasons for Japan's achievement of modern economic growth and a more rapid rate of economic growth than other developed countries and considers the probable future of the Japanese economy. Overviews Japan's economic history; assesses its readiness for modern economic growth; analyzes levels, trends, and fluctuations in its growth rate; and discusses structural changes related to production, demand, population, and labor supply. Also examines the labor market and the dual wage structure, public finances and the financial system, and prices and living standards. The concluding chapter considers future prospects for economic growth, e.g., a lower growth rate and transition to a welfare economy. Minami is Professor of Economics, Institute of Economic Research, Hitotsubashi University, Tokyo. Bibliography; name and subject indexes.

SMITH, KERRI, ed. *Soviet industrialization and Soviet maturity*. Economy and Society series. London and New York: Routledge and Kegan Paul in association with Methuen, New York, 1986. Pp. 214. \$15.95, paper. ISBN 0-7102-0765-4.

JEL 87-0750

Nine papers, most published in *Economy and Society* from 1978-1981, concerned with aspects of Soviet economic and political order. Papers assess and criticize Marxist theory while analyzing the Soviet Union. Major areas of discussion include: (1) the period of the New Economic Policy from 1921 to 1928, emphasizing the policy debates, the ideas and institutions around which it was organized, the causes of its abandonment, and the sys-

tem that finally emerged; (2) the character of Soviet planning and the system of economic calculation, particularly the role of commodity exchange and monetary calculation, the nature of monetary and planning instruments, the social and political significance of monetary calculations, and Soviet planning techniques; (3) the social and constitutional character of the U.S.S.R., as formulated in official doctrine and constitutional arrangements. Smith teaches at the University of Keele. No index.

STAUFFER, ROBERT B. *The Philippines under Marcos: Failure of transnational developmentalism*. Sydney: University of Sydney, Transnational Corporations Research Project, 1986. Pp. 207. Paper. ISBN 0-908470-69-X. JEL 87-0751

Brings together several essays and articles written by the author between 1973 and 1985 presenting the thesis that the then new Marcos government should be viewed in the context of an ongoing struggle over the direction of the country's political economy rather than just an examination of internal Philippine conditions. One theme is the application of dependency/world-system analysis to the third world. Traces the forces in the Philippines by successively discussing the Marcos coup, the political economy of refudalization, the development of Philippine corporatism, Philippine authoritarianism, the development of dependent state capitalism, the Manila-Washington, D.C. connection, the Marcos regime, and the Marcos legacy. Stauffer is Professor of Political Science at the University of Hawaii. No index.

TUAN, NGUYEN ANH. *South Vietnam, trial and experience: A challenge for development*. Monographs in International Studies, Southeast Asia Series no. 80. Athens, Ohio: Ohio University Center for International Studies, Center for Southeast Asian Studies, 1987. Pp. 461. \$15.00, paper. ISBN 0-89680-141-1. JEL 87-0752

Addresses the world's perception of the character of South Vietnam's society, government, and economic system in order to clarify the record as to what sort of social system prevailed during the war years. Begins with an introduction focusing on historical preconditions. The text is divided into two parts. Part 1 examines the years of trial from 1954 to 1975, retracing the evolution of South Vietnam development policies. Subdivides the period into four chapters: 1954-63, examining the problems to come; 1963-68, focusing on the mounting pressures; 1968-73, describing the chances of survival; and 1973-75, dealing with the final outcomes. Part 2 assesses the lessons of experience and contains chapters on the facts of underdevelopment, the burden of the war, the impact of foreign

aid, and the dynamics of change. Concludes with a discussion of the challenge for development. Tuan is a visiting lecturer at the University of Kansas. Bibliography; index.

VARTIA, PENTTI, ET AL. *Growth policies in a Nordic perspective*. Helsinki: Research Institute of the Finnish Economy; Copenhagen: Institute for Future Studies; Stockholm: Industrial Institute Economic and Social Research; Bergen, Norway: Institute of Industrial Economics, 1987. Pp. 376. SKr. 308.00. ISBN 91-7204-276-1. JEL 87-0753

Joint comparative analysis of economic growth in Denmark, Finland, Norway, and Sweden conducted by research institutes in the four countries. Extends the analysis of the 1984 study, *Economic Growth in a Nordic Perspective*, by focusing on economic policy and factor market efficiency. Contains two overview papers, four country-specific papers, and three special studies. The first overview paper considers structural features, recent performance, and the current state of the four Nordic economies as a group, as well as their industrial base and possible growth policies. The second discusses the prospects for world economic recovery in the medium term. The country-specific papers examine the economic status, challenges, and policy options facing each Nordic country. The special studies discuss newly established fast-growing Nordic companies, financial markets, and labor market flexibility. Vartia is at the Research Institute of the Finnish Economy, Helsinki. Rolf Jensen is at the Institute for Futures Studies, Copenhagen, Denmark. Gunnar Eliasson is at the Industrial Institute for Economic and Social Research, Stockholm. Arne Selvik is at the Institute of Industrial Economics, Bergen, Norway. No index.

WALSH, KENNETH AND KING, ADRIAN. *Handbook of international manpower market comparisons*. Institute of Manpower Studies. New York: New York University Press, 1986. Pp. 318. \$90.00. ISBN 0-8147-9217-0. JEL 87-0754

Intended to assist in making international comparisons of key labor market indicators, bringing together in one volume a range of data normally available only in a diverse number of sources. Where available statistics permit, a ten-year historical perspective is presented. Covers sixteen countries, the majority being the constituent members of the European Community: Belgium, Denmark, France, West Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Portugal, Spain, the United Kingdom, Norway, Sweden, Japan, and the United States. Selection of indicators reflects availability of data and the usefulness of the information. Key indicators include demography, labor

force, unemployment, education, industrial relations, labor costs, and consumer prices. Many sub-classifications of statistics appear under the above titles. Recognizes variations in statistical compilation and definitions among the different countries. A comparison is made of selected indicators. Walsh is Research Fellow at the Institute of Manpower Studies, Sussex. King is a management consultant. No index.

### 130 ECONOMIC FLUCTUATIONS; FORECASTING; STABILIZATION; AND INFLATION

AHLSTEDT, MONICA. *Small sample estimation and stochastic simulation of an econometric model*. Helsinki: Suomen Pankki, 1986. Pp. 181. Paper. ISBN 951-686-127-X. JEL 87-0755

Investigates how to improve the reliability of macroeconomic models by minimizing the uncertainty in the estimation phase of the model. Examines how to calculate the variance-covariance matrix of forecasts so as to measure the reliability of the model. Sections consider the estimation of a simultaneous model, measuring the uncertainty in the simultaneous model predictions, empirical estimation, and empirical results of the variance matrix of the forecast error. Concludes that an interactive instrumental estimation method is optimal according to analytical criteria of consistency and relative efficiency and that use of a residual-based stochastic simulation method obtains the best results when calculating the mean and variance of forecasts. The empirical part of the study applies the methods to the structural annual model of the Bank of Finland. Appendices elaborate on the variables, parameter estimates, terms, and definitions used in the study. Ahlstedt is in the Statistics Department, University of Helsinki. No index.

CLEMENTS, R. T.; HANSEN, C. D. AND HAMES, M. J. *The reserve bank econometric model of the New Zealand economy: Model XI*. Research Papers series, no. 40. Wellington: Reserve Bank of New Zealand, 1986. Pp. 62. Free, paper. JEL 87-0756

Outlines the latest version of the Reserve Bank of New Zealand model of the economy. Traces the history of the model from its inception to 1983. Indicates how the model was reestimated and presents a description of the model structure. Examines the simulation properties of the model and reports the results of an international comparison of econometric models' simulation properties. Assesses the acceptability of the model as a forecasting tool, discusses areas of the model currently

under investigation, and suggests further extensions to the model's development. Appendices contain the model specification, data definitions and notation, and a cross-reference of variables. The authors are at the Reserve Bank of New Zealand, Wellington. No index.

EUCKEN, WALTER AND BÖHM, FRANZ, eds. *ORDO: Jahrbuch für die Ordnung von Wirtschaft und Gesellschaft*. Band 37. Stuttgart and New York: Fischer, 1986. Pp. xi, 304. DM 84.00, paper. ISBN 3-437-50304-9. JEL 87-0757

Twelve articles in German with English summaries and seven book reviews, also in German. Topics are: economic policy in the election platforms of the French political parties, Alexander Rüstow's conception of economic and social policy, social policy in the market economy, the role of the shadow economy in market economies and in centrally planned economies, the evolution of private property, competition as a dynamic process, competitive dimensions of the oligopoly market, evasions of regulations in financial markets as a test of concepts of competition policy, a critical assessment of theses of the Federal Cartel Office concerning "buying power" positions in German food retailing, public utilities and the competitive system, forms and causes of the new protectionism, and exchange control and economic growth in developing countries. Name and subject indexes.

FRISCH, HELMUT AND GAHLEN, BERNHARD, eds. *Causes of contemporary stagnation: Proceedings of an International Symposium held at the Institute for Advanced Studies, Vienna, Austria, October 10-12, 1984*. Studies in Contemporary Economics series. Berlin; New York and Tokyo: Springer, 1986. Pp. vii, 216. \$22.60, paper. ISBN 0-387-16485-0. JEL 87-0758

Ten papers investigate the causes of the persistence of stagnation in Western European economies in the 1980s despite a business cycle upturn in the U.S. economy. Papers discuss what the U.S. economic policies could have been; the costs and benefits of a disinflationary policy in West Germany; the nature of price and quantity variability under stagflation; the relevance of business cycle theories to an explanation of the economic slowdown; international portfolio shifts and the choice of monetary rules; an interpretation of long waves in relative prices; the relationship between real wages, business cycles, and unemployment; the applicability of Schumpeterian innovation to an explanation of stagflation; the relationship between wage rate variation and the level of unemployment; and the role of asymmetric adjustment costs and price stickiness. Frisch is with the Institut für Volk-

swirtschaftslehre und Wirtschaftspolitik, Vienna. Gahlen is at Lehrstuhl für Volkswirtschaftslehre I, Augsburg University, West Germany. No index.

INTERNATIONAL LABOUR OFFICE. *World recession and global interdependence: Effects on employment, poverty and policy formation in developing countries*. Geneva: Author, 1987. Pp. xi, 139. Paper. ISBN 92-2-105608-2. JEL 87-0759

Six papers analyze the world recession that occurred after 1973, the nature of international economic linkages, and the impact on developing economies in Latin America, sub-Saharan Africa, and Asia. One paper reviews the characteristics of the recession in industrialized and developing countries, changes in developing country imports, and employment in OECD countries. A second paper traces trends in world and regional trade and in resource flows and direct foreign investment. Three papers outline the impact on economic performance, domestic economic policies with special reference to adjustment, and stabilization policies in Latin America, sub-Saharan Africa, and Asia. A final paper examines the effects and spread of (and adjustment to) the crisis and analyzes prospects for recovery. The contributors are: R. van der Hoeven, P. J. Richards, V. Tokman, J. Wurgaft, A. Aboagye, K. Gozo, I. Ahmed, and E. Lee, who are associated with the ILO and its Regional Employment Teams. No index.

ISSERMAN, ANDREW M., ed. *Population change and the economy: Social science theories and models*. Dordrecht, the Netherlands and Lancaster: Kluwer Academic, Kluwer-Nijhoff; distributed in the U.S. and Canada by Kluwer Academic, Hingham, Mass., 1986. Pp. xvii, 269. \$42.50. ISBN 0-89638-140-1. JEL 87-0760

Eleven papers originally presented at the Second International Conference on Forecasting Regional Population Change and Its Economic Determinants and Consequences sponsored by the American Statistical Association and U.S. Bureau of the Census at Arlie, Virginia, in May 1982 as part of the ASA/Census program supported by NSF to build the interregional economic-demographic model of the United States (ECESIS). The papers are chosen to reflect the state-of-the-art ability to model economic-demographic interrelationships mathematically, using computers and real data; their emphasis is on models for regions, states, provinces, or metropolitan areas. The three papers in part 1 examine the economic determinants of migration and fertility rates; they review the theoretical literature and discuss forecasting for regional births and for interregional migration. Part 2 consists of three papers that present regional

economic-demographic models for Texas and New York, and related modeling strategies. Part 3 contains three papers that describe various economic-demographic modeling frameworks, including ECESIS. The remaining two papers in part 4 discuss the progress and prospects for regional economic-demographic modeling and models. The contributors are mainly economists, social scientists, and population specialists. Isserman is Director of the Regional Research Institute and Professor of Economics and Geography, West Virginia University. No index.

JONES, RUSSELL. *Wages and employment policy, 1936-1985*. With a foreword by SIR ALEC CAIRNCROSS. London; Winchester, Mass. and North Sydney: Allen and Unwin, 1987. Pp. xvii, 175. \$29.95, cloth; \$14.95, paper. ISBN 0-04-331111-3, pbk. JEL 87-0761

A history of British incomes policy or actions to restrict collectively bargained wage increases in order to reduce wage inflation. Investigates the development of thinking and policy in successive governments since 1936. Describes why measures taken to ameliorate the wages problem kept failing, focusing on the errors in policy formulation. Inquires whether there is a future for Keynesian economic policies or whether monetarist techniques will continue indefinitely. Examines which lessons from the past can be applied to the wage problem in view of a new era of Keynesian policy prescriptions and the disillusionment with monetarism. Concludes that the inflationary process that helped undermine Keynesianism was rooted in deep economic, institutional, social, and political forces, with a tendency of successive governments to overstimulate the economy. Suggests that future incomes policies that have long-run objectives, have the support of both labor and management, involve tax-based incomes proposals, and embody wage restraints would have a chance of success. Jones is Senior Currency Economist at James Capel Bankers Ltd. Bibliography; index.

KLEINKNECHT, ALFRED. *Innovation patterns in crisis and prosperity: Schumpeter's long cycle reconsidered*. Foreword by JAN TINBERGEN. New York: St. Martin's Press, 1987. Pp. xviii, 235. \$32.50. ISBN 0-312-41816-7. JEL 87-0762

Analysis of long waves in economic life. Considers their existence, characteristics, and causes. Deals with the origin and renaissance of the long wave, their analysis by J. van Gelderen, and the nature of the controversy between Simon Kuznets and Joseph Schumpeter regarding the forces underlying long waves. Part 1 investigates the existence of long waves. Part 2 analyzes the occurrence

of radical innovations in order to determine the existence of clustering and examines the relationship between cluster of radical innovations and long wave fluctuations in the economy. Part 3 reviews data from the post World War II period and focuses on characteristics of the innovation process during the upswing and upper turning point of the postwar long wave. Concludes that waves of radical innovations are an endogenous part of the long wave process and that prolonged depressions may trigger a reallocation of innovative resources and exert pressure toward social, political, and institutional change. Kleinknecht is Lecturer in Economics at Limburg University in Maastricht, the Netherlands. Bibliography; index.

MAGER, NATHAN H. *The Kondratieff waves*. New York and London: Greenwood, Praeger, 1987. Pp. viii, 247. \$37.95. ISBN 0-275-92149-2. JEL 87-0763

Examines the Kondratieff wave theory from the perspective of current evidence and experience. Begins with an introduction to the historical account of economic cycles, including ancient concepts, the national cycles theory, the background of economic cycles, the Keynesian approach, macroeconomic models, and rational expectations. Identifies four current approaches—Keynesian monetarist, rational expectations, and supply side. Follows with a discussion of the long wave cycle—a duration of 50-60 years—the Kondratieff wave, including comments and criticisms. Reviews four such waves: 1789-1814-43; 1843-64-96; 1896-1920-49; and 1949-73-2003. Analyzes causes and consequences of these waves, emphasizing innovation, investment, and maturation and war, demographics, and social change. Concludes with a preview of a fifth wave, with contributing factors such as the decrease in the U.S. competitive position, the increase in world debt, the plight of many banks, the population growth in LDCs, and the changing industrial-service pattern. Mager is a freelance writer. No index.

RAYACK, ELTON. *Not so free to choose: The political economy of Milton Friedman and Ronald Reagan*. New York and London: Greenwood Press, Praeger, 1987. Pp. x, 215. \$37.95. ISBN 0-275-92363-0. JEL 87-0764

Primary focus is an analysis of some of the major themes in the popular writings of Milton Friedman, covering some 300 columns in *Newsweek* two popular best sellers—*Capitalism and Freedom* and *Free to Choose*, and essays and interviews appearing in other popular publications. Includes commentaries on his ideas about the role of government; the political case for free trade; free markets,

planning, and the Chilean experience; the attack on the welfare state; big government; a variety of social programs; and freedom and equality. Argues, contrary to Friedman's beliefs, that not all social programs have been failures, that free markets do not necessarily produce peace, that economic growth is not necessarily inhibited by growth in government, and that the Chilean free market experience was more a disaster than a miracle. Discusses fallacies of monetarism. Asserts that Reagan's announced programs, though following the Friedman philosophy in areas such as tax cuts, curbing social programs, cutting expenditures, and espousing free trade, have diverged from it. Concludes that Friedman's one-sided balance sheet on social issues has denied the reader "the opportunity to be truly free to choose." Rayack is Professor of Economics at the University of Rhode Island. Bibliography; index.

UNITED NATIONS DEPARTMENT OF INTERNATIONAL ECONOMIC AND SOCIAL AFFAIRS. *Economic recession and specific population groups*. U.N. Publication Sales No. E.86.IV.4. New York: Author, 1986. Pp. 99. \$11.00, paper. ISBN 92-1-130110-6.

JEL 87-0765

Deals with the effects of international stagnation and recession on specific population groups, particularly during 1973-75 and 1981-83. Assumes that conditions faced by these groups are the result of factors affecting society as a whole and forces distinctive to each group. Describes the major features of international recessions, emphasizing employment and likely poverty trends in developing countries. Reviews policy making in periods of crisis and the social impact of some policies on employment, wages, and social services. Discusses solidarity and social support in the family, community, and nation during recessionary periods. Examines the impacts of recession on youth and the aged. Concludes that the international recession has affected countries with different levels of development and economies, with some experiencing more severe effects than others. No index.

## Quantitative Economic Methods and Data

### 210 ECONOMETRIC, STATISTICAL, AND MATHEMATICAL METHODS AND MODELS

MYERS, JEAN M. AND PRESSER, STANLEY. *Survey questions: Handcrafting the standardized ques-*

*tionnaire*. Quantitative Applications in the Social Sciences Series, Sage University Paper, no. 63. Beverly Hills, London and New Delhi: Sage, 1986. Pp. 80. \$6.00, paper. ISBN 0-8039-2743-6.

JEL 87-0766

Presents guidelines for writing survey questions. Examines general strategies that have emerged from examples or experience of "question-crafters" and findings of empirical researchers, e.g., simple language, common concepts, manageable tasks, and widespread information. Surveys recent research findings related to question design and question effects. Examples of topics are: specific vs. general and open vs. closed questions, the no-opinion option, measuring intensity, forced-choice questions, question order, and wording effects. Also considers pilot work and the strategies, purposes, and phases of pretesting. Converse is Director of the Detroit Area Study, University of Michigan. Presser is Associate Director of the Sociology Program, National Science Foundation, Washington, D.C. No index.

FEIRING, BRUCE R. *Linear programming: An introduction*. Quantitative Applications in the Social Sciences Series, Sage University Paper, no. 60. Beverly Hills; London and New Delhi: Sage, 1986. Pp. 91. \$6.00, paper. ISBN 0-8039-2850-5.

JEL 87-0767

Considers linear programming modeling concepts and examples, graphical solutions of linear programs in two variables, the Simplex Method for solving linear programs, sensitivity analysis, and computer linear programming codes for understanding input and output of commercially available linear programming (LP) systems. Examples and problems are interspersed throughout the text. Two appendices provide mathematical development of the properties of linear programming problems and methods for production scheduling. Feiring is a consultant and Adjunct Associate Professor of Management Sciences, University of Minnesota. No index.

FOX, JAMES ALAN AND TRACY, PAUL E. *Randomized response: A method for sensitive surveys*. Quantitative Applications in the Social Sciences series, Sage University Paper, no. 58. Beverly Hills; London and New Delhi: Sage, 1986. Pp. 80. \$6.00, paper. ISBN 0-8039-2309-0.

JEL 87-0768

Describes the randomized response survey method and how it can be used to protect survey respondents and minimize survey bias when estimating behavioral frequencies when the behavior is sensitive, socially disapproved, or perhaps criminal. The first section identifies the kinds of measurement problems customary in survey research.

describes the ethical and legal problems inherent in surveying human subjects, and discusses the inadequacy of traditional approaches that have been adopted to minimize these problems. The remainder of the book discusses the randomized response technique and applications of randomized response methods. Examines randomized response strategies, design considerations, polychotomous and quantitative measures, subgroup comparisons, measures of association, and disclosure control. Reviews substantive applications of the methods, studies that compare randomized response to other survey methods, and related validation research. Concludes that the randomized response method warrants serious consideration in survey efforts. Fox is Professor of Criminal Justice, and Tracy is Assistant Professor and Director of the Graduate Program in Criminal Justice, Northeastern University, Boston. No index.

HANEVELD, WILLEM K. KLEIN. *Duality in stochastic linear and dynamic programming*. Lecture Notes in Economics and Mathematical Systems series, vol. 274. New York; Berlin; London and Tokyo: Springer, 1986. Pp. vii, 295. \$30.30, paper. ISBN 0-387-16793-5. JEL 87-0769

An analysis of certain problems that arise in stochastic linear programming and stochastic dynamic programming. Introduces the terminology of mathematical programming and presents the duality theory of convex programming problems in abstract space. Deals with the specification of linear programming models, covers multistage stochastic linear programming models, and discusses the relationship between stochastic linear programming and stochastic dynamic models. Presents a general framework for abstract linear programming duality and analyzes the nature of linear chance constraints. Deals with the behavior of the optimal value operator of dynamic programming, robustness against dependence in PERT, and presents and analyzes a production-inventory model. Haneveld is associated with the Institute of Econometrics, University of Groningen, the Netherlands. Subject index.

JOHNSON, AARON C., JR.; JOHNSON, MARVIN B. AND BUSE, RUEBEN C. *Econometrics: Basic and applied*. New York: Macmillan; London: Collier Macmillan, 1987. Pp. xv, 480. \$29.00. ISBN 0-02-360930-6. JEL 87-0770

Introductory textbook focusing on applied research; prerequisites are an introductory statistics course and familiarity with population parameter estimation, hypothesis testing, and with the theory of a specific discipline. Covers: the principle of

equation regression theory and simple regression, multiple regression, correlation, distribution theory and hypothesis testing, and matrix notation. Covers practical application of regression techniques to research problems. Presents standard econometric problems i.e., multicollinearity, omitted relevant and included irrelevant variables, heteroscedasticity and autocorrelation, and sample deficiencies. Discusses the use of time in applied regression analysis. Considers the writing of research reports and presents the basic theorems of matrix algebra and their relationship to regression theory. Each chapter ends with a summary, list of new terms, and exercises. Also contains an appendix of statistical tables, suggested readings, and answers to selected exercises. The authors are at the University of Wisconsin, Madison. Glossary; index.

KLOCKARS, ALAN J. AND SAX, GILBERT. *Multiple comparisons*. Quantitative Applications in the Social Sciences series, Sage University Paper, no. 61. Beverly Hills; London and New Delhi: Sage, 1986. Pp. 87. \$6.00, paper. ISBN 0-8039-2051-2. JEL 87-0771

Introduction to the methods most commonly used in the social and behavioral sciences to investigate differences between levels of an independent variable within an experimental design; emphasizes tests of significance. Reviews the analysis of variance and hypothesis testing, describing the dimensions on which multiple comparisons vary and methods for *a priori* comparisons, pairwise methods for *post hoc* comparisons, and the Scheffé Test for *post hoc* comparisons. Considers multiple comparisons in factorial designs and testing comparisons of interaction. Also addresses issues of unequal sample size and violations of assumptions. Klockars is Professor of Educational Psychology and Sax is professor of Education and Psychology, both at the University of Washington. No index.

KMENTA, JAN. *Elements of econometrics*. Second edition. New York: Macmillan; London: Collier, [1971] 1986. Pp. xii, 786. \$26.50. ISBN 0-02-365070-2. JEL 87-0772

Second edition of an introductory econometrics textbook. [See JEL no. 71-1087 for annotation of the first edition.] Revisions in this edition include simplification of exposition and introduction of new topics, such as: heteroskedasticity and autocorrelated disturbances; errors of measurement and grouped data; multicollinearity and specific errors; restricted coefficients, nonlinear models, and distributed lags; pooling of cross section and time series data; and special topics. Presents new material

section on Bayes theorem and Bayesian inference, new sections on nonnormality and nonzero means of the disturbance, and qualitative or limited dependent variables. Requires mathematical background, including college algebra, calculus, and some descriptive statistics. Kmenta is Professor of Economics and Statistics at the University of Michigan. Index.

U, H. T. *Combinatorial heuristic algorithms with FORTRAN*. Lecture Notes in Economics and Mathematical Systems series, vol. 280. New York; Berlin; London and Tokyo: Springer, 1986. Pp. 26. \$16.10, paper. ISBN 0-387-17161-4.

JEL 87-0773

Analysis of the use of combinatorial heuristic algorithms. Part 1 deals with integer programming and covers integer linear programming, zero-one linear programming, and the zero-one knapsack problem. Part 2 considers network design and includes the traveling salesman problem, the Steiner tree problem, graph partitioning, the K-median location problem, and the K-center location problem. All programs for these problems are written in FORTRAN-77. Lau is associated with Bell-Northern Research, Quebec, Canada. No index.

TRKPOHL, HELMUT. *Forecasting aggregated vector ARMA processes*. Lecture Notes in Economics and Mathematical Systems series, no. 284. New York; Berlin; London and Tokyo: Springer, 1987. Pp. 323. \$32.80, paper. ISBN 0-387-17208-4.

JEL 87-0774

Compares predictors, specifically focusing on the level of aggregation of the data used for prediction. Data generation processes are assumed to be multivariate, nondeterministic, discrete-time stochastic processes that are, or can be made, stationary. The mean squared forecasting error is used as a measure of forecast accuracy. Examines vector stochastic processes, forecasting vector stochastic processes, forecasting contemporaneously aggregated known and estimated processes, forecasting temporally and contemporaneously aggregated known processes, temporal aggregation of stock and flow variables, and joint temporal and contemporaneous aggregation. A general conclusion is to use disaggregate data for prediction of the aggregate if a variable is a contemporaneous and temporal aggregate. The author is at the Institute for Statistics and Economics, University of Hamburg. Bibliography; no index.

SHROEDER, LARRY D.; SJOQUIST, DAVID L. AND STEPHAN, PAULA E. *Understanding regression analysis: An introductory guide*. Quantitative Ap-

plications in the Social Sciences series, Sage University Paper, no. 57. Beverly Hills; London and New Delhi: Sage, 1986. Pp. 95. \$6.00, paper. ISBN 0-8039-2758-4.

JEL 87-0775

Provides a heuristic explanation of the basic procedures and terms used in regression analysis and the background needed to understand empirical work that relies on regression analysis; assumes no statistics and only a minimal mathematics background. Focuses on the intuitive and verbal interpretation of regression coefficients, associated statistics, and hypothesis tests. Also explains other terminology encountered in literature and discusses major problems and issues encountered in regression analysis. Can be used as a supplementary text in a variety of courses; uses examples from business, education, and the social sciences. An earlier, more limited version was published under the title *Interpreting Linear Regression Analysis: A Heuristic Approach*. Schroeder is Professor of Public Administration and Economics in the Maxwell School and Director of the Metropolitan Studies Program, Syracuse University. Sjoquist is Professor of Economics and Stephan is Professor of Economics and Industrial Relations, Georgia State University. No index.

SEIERSTAD, ATLE AND SYDSAETER, KNUT. *Optimal control theory with economic applications*. Amsterdam; New York; Oxford and Tokyo: Elsevier Science, North-Holland; distributed in North America by Elsevier Science, New York, 1987. Pp. xvi, 445. \$49.50. ISBN 0-444-87923-4.

JEL 87-0776

Intended to serve as an introduction, advanced text, and reference source to the theory of deterministic control of systems governed by ordinary differential equations. Includes an introduction to the classical calculus of variations. Contains a large number of examples whereby the theory is applied to a variety of economic problems. Theoretical sections concentrate on rendering existence results, necessary conditions, and sufficient conditions. Models are used to illuminate qualitative and analytical points and cover growth, exploitation of resources, control of pollution, firm behavior, and differential games. Slight attention is given to dynamic programming and feedback controls. Introduction reviews concepts such as the state of the system, and static optimization. Chapters discuss the calculus of variations and optimal control theory with and without restrictions on state variables. A number of exercises are included, with answers. Seierstad and Sydsater are at the University of Oslo. Index.

SENGUPTA, JATI K. *Stochastic optimization and economic models*. Theory and Decision Library Series

B: Mathematical and Statistical Methods. Dordrecht, the Netherlands; Boston; Lancaster and Tokyo: Kluwer Academic, Reidel; distributed in the U.S. and Canada by Kluwer Academic, Norwell, Mass., 1986. Pp. x, 373. \$79.50. ISBN 90-277-2301-X. JEL 87-0777

Considers the main aspects of stochastic optimization in economic models. Stochastic processes and control theory under optimization are used to illustrate the various economic implications of optimal decision rules. The objective is to present a critical overview of the area from a multidisciplinary perspective. Major topics discussed include: portfolio models in finance, differential games under uncertainty, self-tuning regulators, models of renewable resources under uncertainty, and nonparametric methods of efficiency measurement. The selected models are used to evaluate stochastic processes such as the Wiener process, jump process, and diffusion process in their implications for operational usefulness in policy making, computational flexibility, and adaptivity to new information and data. The author is Professor of Economics and Operations Research, University of California, Santa Barbara. Author and subject indexes.

SPANOS, ARIS. *Statistical foundations of econometric modelling*. Cambridge; New York and Sydney: Cambridge University Press, 1986. Pp. xxiii, 685. \$34.50. ISBN 0-521-26285-2. JEL 87-0778

Designed as a textbook for advanced undergraduate and graduate level courses in econometric theory and as a reference book for research workers in applied econometrics. Prerequisites are basic courses in set theory, calculus, and linear algebra; no prior knowledge of probability, statistics, and/or econometric theory is assumed. Proposes an econometric modeling framework based on both economic theory and the structure of the observed data; emphasis is on choice of appropriate statistical models and misspecification testing. Part 1 presents an introduction to econometrics and the descriptive study of data. Parts 2 and 3 provide the background in probability theory and statistical inference needed to build an econometric methodology. Part 4 considers statistical models of interest in econometrics as extensions of the models presented in part 3. Models discussed include: the Gauss linear model, linear regression model, dynamic linear regression model, multivariate linear regression model, and simultaneous equations model. Uses examples to illustrate how concepts and procedures related to estimation, misspecification testing, and reparameterization can be used in practice. Spanos is Lecturer in Economics, Birkbeck College, London University. Index.

WOLF, FREDRIC M. *Meta-analysis: Quantitative methods for research synthesis*. Quantitative Applications in the Social Sciences Series, Sage University Paper, no. 59. Beverly Hills; London and New Delhi: Sage, 1986. Pp. 65. \$6.00, paper. ISBN 0-8039-2756-8. JEL 87-0779

Describes the meta-analysis approach, i.e., the application of statistical procedures to integrate, synthesize, and review collections of empirical findings from individual studies. Overviews the method and its use and discusses its advantages and the criticisms it has received. Presents three of the more common statistical tests (Fischer, Winer, and Stouffer combined tests) for combining the results of independent tests of the same hypothesis and discusses their selection. Considers measures of effect size for group differences and correlational relationships. Discusses methods for examining possible interactions or mediating effects and how to select a common metric to aggregate diverse statistics across studies. Examines bias problems and their reduction, including the file-drawer problem, weighting by sample size, unbiased estimate of effect size, tests of homogeneity, nonindependent results, validity, and reliability. Reviews nonparametric methods of effect size. The concluding chapter summarizes the strengths and limitations of meta-analysis and outlines guidelines when using it. Wolf is Assistant Professor of Postgraduate Medicine and Health Professions Education, University of Michigan. No index.

## 220 ECONOMIC AND SOCIAL STATISTICAL DATA AND ANALYSIS

ALESSANDRINI, SERGIO AND DALLAGO, BRUNO, eds. *The unofficial economy: Consequences and perspectives in different economic systems*. Aldershot, England and Brookfield, Vt.: Gower, 1987. Pp. 345. \$47.50. ISBN 0-566-05131-1.

JEL 87-0780

Twenty-one papers given at a seminar at the University of Trento on the unofficial economy, where over thirty anthropologists, sociologists, and economists from Europe, the United States, and Israel discussed its characteristics and importance. Organized into four parts. Papers in part 1 identify the nature and extent of the problem and describe the difficulties in determining accurate definitions of the unofficial economy. The second part discusses economic systems and contains papers that make an intersystematic comparative approach and those that present the main features of the unofficial economy in one specific system. Special attention is given to North Africa, Poland, and Hungary. Part 3 includes papers combining economic, socio-

logical, and anthropological analyses of specific organizational forms in various contexts. Papers concentrate on the effects of anti-Mafia law, the informal work of industrial workers, and the second economy in Soviet Georgia. The last part comments on consequences of the unofficial economy, specifically welfare and income distribution, and examines the measurement of hidden personal income in the U.S.S.R., expansion of the second economy in Hungary, welfare economic aspects, optimal income taxation, the untaxed sector, the inequality impact in Yugoslavia, and macroeconomic disequilibrium and the size of the unofficial economy in Poland. Alessandrini and Dallago are at the University of Trento. No index.

LYE, MICHAEL R. AND BLACK, DAN A. *Consumer behavior, cost of living measures, and the income tax*. Lecture Notes in Economics and Mathematical Systems series, vol. 276. New York; Berlin; London and Tokyo: Springer, 1986. Pp. 119. \$16.00, paper. ISBN 0-387-16797-8. JEL 87-0781

Provides a guide to the theory of consumer behavior and the construction of measures of the cost of living, focusing primarily on theoretical issues. Considers the traditional framework that ignores taxes and extends the theories to allow for an income tax. Organized as follows: overview and mathematical preliminaries, the theory of consumer behavior both in the absence and presence of an income tax, the authors' derivation of economic indices both in the absence and presence of taxation, and practical issues that arise in applying the derived theory. Assumes familiarity with calculus and set-theoretic concepts. Baye is a member of the Department of Economics, Texas A&M University. Black is a member of the Department of Economics, University of Kentucky. Bibliography; no index.

UPRIEZ, LEÓN H., ed. *Economic progress: Proceedings of a conference held by The International Economic Association at Santa Margherita Ligure, Italy*. Second edition. Edited by AUSTIN ROBINSON. New York: St. Martin's Press, [1955] 1967. Pp. xxviii, 399. \$45.00. ISBN 0-312-23633-6. JEL 87-0782

Reprint of the proceedings of a conference on Economic Progress held by the International Economic Association in 1953 with the addition of an index and a new introduction by Austin Robinson who comments on the 1953 thinking on economic progress and development. Nineteen contributions are divided into six parts as follows: (1) the Meaning and Criteria of Economic Progress; (2) the Progress of Industrialization; (3) Investment and Progress; (4) Entrepreneurship, Technological Change and

Social Organization, (5) Public Policy for Economic Progress; and (6) the Theory of Secular Progress. Also includes the summary records of the discussions of papers. Robinson was (at the time of the conference) Professor of Economics at Cambridge. Index.

UNITED NATIONS DEPARTMENT OF INTERNATIONAL ECONOMIC AND SOCIAL AFFAIRS, STATISTICAL OFFICE. *Handbook of national accounting. Accounting for production: Sources and methods*. Studies in Methods, Series F, no. 39. U.N. Publication Sales No. E.86.XVII.11. New York: United Nations, 1986. Pp. xi, 180. \$17.50, paper. ISBN 92-1-161264-0. JEL 87-0783

A manual on sources and methods for compiling the production statistics needed for the U.N. System of National Accounts as reflected in the U.N. National Accounts Questionnaire. Describes sources and methods for compiling gross domestic product both as the sum of the output of different producers and as the sum of final uses of that output; concerned only with estimates at current prices. Part 1 is a general introduction to the subject. It includes definitions and classifications, an overview of national accounts methodology, and basic sources of data. Part 2 describes the production approach to GDP and GDP by kind of activity. Part 3 considers the cost components of GDP, and part 4, final expenditures on GDP. Also available in French, Russian, and Spanish. Bibliography; no index.

WOLFF, EDWARD N. *Growth, accumulation, and unproductive activity: An analysis of the postwar U.S. economy*. Cambridge: New York and Melbourne: Cambridge University Press, 1987. Pp. xi, 201. \$37.50. ISBN 0-521-25151-6. JEL 87-0784

Marxian analysis of the impact of a rising level of unproductive activity on capital accumulation and productivity. Documents the importance of unproductive labor activity in the postwar American economy (1947-76) and assesses its implications. Presents a methodology by which standard accounting frameworks can provide an empirical basis for categories of Marxian analysis and develops a growth model to assess the effect of unproductive activity on surplus generation, capital accumulation, and the growth in productivity. Finds that the shift of resources to unproductive activities has reduced new capital formation and productivity growth and eroded the rate of growth in per capita living standards. Wolff is Professor of Economics, New York University.

### 300 Domestic Monetary and Fiscal Theory and Institutions

#### 310 DOMESTIC MONETARY AND FINANCIAL THEORY AND INSTITUTIONS

BRANDEIS, LOUIS D. *Other people's money and how the bankers use it*. Reprint of second edition. Reprints of Economic Classics series. Fairfield, N.J.: Kelley, [1914, 1932] 1986. Pp. lxii, 223. \$25.00. ISBN 0-678-00856-6. JEL 87-0785

Includes a preface to the first edition as well as a lengthy foreword to the second by Norman Hapgood, a colleague of Brandeis. Most of the articles reprinted appeared in *Harper's Weekly* in 1913 and 1914. Essays discuss financial oligarchies, bank combinations, interlocking directorates, banking and the Pujo Committee recommendations, the role of publicity as a remedy for improper combination and control, the role of bankers in connection with state and local government bond issues, the role of big banks in industrial development, size as a factor in the rise of bank combinations, the failure of banker management, and the inefficiencies of oligarchies. The foreword, "Prophet and Statesman," discusses how Brandeis' philosophy influenced Supreme Court opinion and how history has tested the soundness of the philosophy. No index.

CHUA, JESS H. AND WOODWARD, RICHARD S. *Gains from stock market timing*. Monograph Series in Finance and Economics, no. 1986-2. New York: New York University, Graduate School of Business Administration, Salomon Brothers Center for the Study of Financial Institutions, 1986. Pp. 75. \$7.00, paper. JEL 87-0786

Reviews the academic literature on the subject of market timing and presents some new empirical tests and results on its value. After a general introduction, considers the importance of the accuracy required for market timing. Presents test results summarizing the returns to timing. Examines the cost and value of market timing. Section 4 reviews the literature on market timing performance. Cautions that different measures are applicable to each particular situation. Section 5 evaluates the timing and stock selection performance of samples of mutual funds from the United States and Canada over a ten-year period. The last section examines how existing technology can be used to improve the management of market timing activities. Chua is an Associate Professor of Financial Management and Woodward is an Associate Professor of Finance at the University of Calgary. No index.

DEVINNEY, TIMOTHY M. *Rationing in a theory of the banking firm*. Studies in Contemporary Economics

series. Berlin; New York and Tokyo: Springer, 1986. Pp. vi, 102. \$16.00, paper. ISBN 3-540-16052-3. JEL 87-0787

Develops a theory of credit rationing based upon the existence of risk-reducing informational technologies in which rationing is not so much the result of risk per se but rather the bank's ability to recognize and react to that risk. Discusses prior credit rationing theories, presents a model of credit rationing as a function of an information technology, and examines the informational value of long-term bank-customer relations. The concluding chapter considers implications of the theory for the role of nonprice rationing in a general equilibrium framework and regulatory and monetary policy. Devinney is Assistant Professor of Management, Owen Graduate School of Management, Vanderbilt University. No index.

FISHER, IRVING. *The theory of interest as determined by impatience to spend income and opportunity to invest it*. Reprints of Economic Classics series. Fairfield, N.J.: Kelley, [1930] 1986. Pp. xxvii, 566. \$37.50. ISBN 0-678-00003-4. JEL 87-0788

Addressed to financial and industrial leaders and professors and students of economics, in recognition of the expansion of credit after World War I to finance military operations, postwar reparations, reconstruction, and rebuilding of industry and trade. Recognizes the advent of inflation and the decline in real interest rates or fixed income securities. Presents an intensive analysis of the relationships between prices and interest rates. Part 1 is a general introduction, discussing income and capital, money and real interest, and some common pitfalls. Part 2 presents the theory "in words" for those with a "distaste for mathematics." Part 3 describes the theory in mathematical and statistical terms. The last part analyzes a variety of topics, such as the place of interest in the economy, the relation of discovery and invention to interest rates, personal and business loans, and relation of interest to money and prices. The late Irving Fisher was Professor of Economics at Yale University. Bibliography; index.

FRIEDMAN, BENJAMIN M., ed. *The changing roles of debt and equity in financing U.S. capital formation*. Paperback reprint. National Bureau of Economic Research Project Report series. Chicago and London: University of Chicago Press, [1962] 1987. Pp. vii, 115. Paper. ISBN 0-226-26342-8. JEL 87-0789

Paperback reprint. [See JEL no. 82-1190 for annotation and JEL, Volume 21, no. 1 (March 1983), p. 1538 for a review.]

ANON, JAMES A. AND ROCHA, ROBERTO DE REZENDE. *High interest rates, spreads, and the costs of intermediation: Two studies*. Industry and Finance Series, vol. 18. Washington, D.C.: World Bank, 1986. Pp. x, 82. \$5.00, paper. ISBN 0-8213-0835-1.

JEL 87-0790

Two papers analyze the determinants of high interest rates. James A. Hanson examines the relationship between spreads and explicit taxes as well as implicit taxes on financial intermediation. Reviews the repercussions of high spreads on operating costs and profits and presents an agenda for reducing spreads. Roberto de Rezende Rocha presents a cross-country analysis of the costs of intermediation in developing countries. Investigates the determinants of banking costs and profits, including inflation and market structure, and suggests certain policy options. Hanson is Senior Financial Economist with, and Rocha is a consultant to, the Industry Department of the World Bank. No index.

ORVITZ, PAUL M. AND WARD, RICHARD A. *Monetary policy and the financial system*. Sixth edition. Englewood Cliffs, N.J.: Prentice-Hall, [1963 . . . 1983] 1987. Pp. xii, 532. ISBN 0-13-599861-1.

JEL 87-0791

Revised and updated edition of a textbook for use in courses in financial markets, financial institutions, and money and banking in the United States. [For annotation of fifth edition see JEL no. 83-0398.] Uses the Federal Reserve flow-of-funds as the integrating mechanism to examine the financial system and focuses on interest rates and theory, including loanable funds and liquidity preference theories and the effects of deposit interest on interest theory. Chapters contain summaries, questions, and reading lists. Instructor's manual available. Horvitz is Judge James A. Elkins Professor of Banking and Finance at the University of Houston. Ward is Emeritus Professor of Finance and Business Economics, University of Southern California. Glossary; index.

BAL, ZUBAIR AND MIRAKHOR, ABBAS. *Islamic banking*. Occasional Paper series, no. 49. Washington, D.C.: International Monetary Fund, 1987. Pp. vi, 62. \$7.50, paper. ISBN 0-839934-82-5.

JEL 87-0792

Describes certain salient features of the Islamic banking system and analyzes the experiences of the Islamic Republic of Iran and Pakistan, both of which have taken steps recently to bring their banking systems in closer accord with Islamic principles. The first section describes theoretical aspects of an Islamic banking and financial system. Describes the banking system, financial markets,

savings and investment, and central banking and monetary policy. The second and third sections present a detailed discussion of Islamic banking in Iran and Pakistan, with particular attention to bank liabilities and assets, monetary policy, banking regulation, government borrowing, and asset concentration; examine problems that have or could hinder the implementation of Islamic banking. Section 4, a summary, finds that the absence of interest does not reduce the effectiveness of monetary policy or the central banks' ability to perform their traditional roles. Appendices contain a detailed review of Islamic banking laws. Iqbal is with the Middle Eastern Department and Mirakhor is with the Research Department of the IMF. Glossary; bibliography; no index.

PRODANO, SYLVIO. *Pension funds: Investment and performance*. Gower Studies in Finance and Investment series, no. 3. Aldershot, England and Brookfield, Vt.: Gower, 1987. Pp. xiii, 166. \$50.95. ISBN 0-566-00617-3.

JEL 87-0793

A study of the U.K. pension fund investments and their performance, based on secondary data sources and primary data from practicing fund managers and trustees of pension funds. Begins with a discussion of pension fund assets, their remarkable recent growth, their tax status, and asset reversion resulting from fund values exceeding liabilities. Describes fund investment policy and strategy. Notes importance of strategy because of the size of pension funds in relation to available U.K. equity. Provides a review of investments in securities, commercial and industrial property, currency, housing, agricultural land and foreign investment. Describes a variety of methods for evaluating performance with considerations for incorporating risk and uncertainty. Reviews basic portfolio analysis and discusses risk and portfolio performance. Concludes with a discussion of funding and the valuation of assets. Prodano is Director of Studies at Pembroke College, University of Cambridge. Bibliography; index.

STOLL, HANS R. AND WHALEY, ROBERT E. *Expiration day effects of index options and futures*. Monograph Series in Finance and Economics, 1986-3. New York: New York University, Graduate School of Business Administration, Salomon Brothers Center for the Study of Financial Institutions, 1986. Pp. 91. \$7.00, paper.

JEL 87-0794

Examines the characteristics and uses of index futures and options and the volume of trading in these instruments. Recognizes that the effectiveness of options and futures as tools for hedging and risk management depends on a system of arbitrage price linkages to the underlying stock indices.

Describes these linkages and the arbitrage process, and the number and magnitude of arbitrage opportunities. Discusses cash settlement procedures as the potential source of expiration day price effects. Analyzes open interest in futures and stock options and volume behavior around expiration days. The effects of stock market prices associated with the expiration of options and futures is also analyzed, noting that the unwinding of arbitrage positions can cause price pressures; examines the spread between futures and cash index prices. Considers predicting expiration day price effects on the basis of past arbitrage opportunities and concludes that the process is difficult; also, the higher the degree of market predictability, the less the opportunity to make profits from the ability to predict. Notes that empirical data indicate a decline in number and magnitude of arbitrage opportunities. Stoll is Professor of Finance at the Owen Graduate School of Management, Vanderbilt University, and Whaley is Associate Professor of Finance at the Fuqua School of Business, Duke University. No index.

UNITED NATIONS DEPARTMENT OF INTERNATIONAL ECONOMIC AND SOCIAL AFFAIRS. *Savings for development: Report of the Third International Symposium on the Mobilization of Personal Savings in Developing Countries, Yaoundé, Cameroon, 10-14 December 1984*. U.N. Publication Sales No. E.85.II.A.17. New York: United Nations, 1986. Pp. viii, 114. \$14.50, paper. ISBN 92-1-104172-4. JEL 87-0795

Contains the symposium report and recommendations, a summary of the meeting of experts to prepare the symposium, and thirteen selected papers presented to the symposium. Topics of the symposium report include: interest rates and related issues and ways of enhancing the effectiveness of the framework for the mobilization of personal savings in developing countries, i.e. making the institutional financial sector more efficient, maximizing the contribution of the noninstitutional sector to the mobilization of personal savings, and strengthening the link between the sectors. Also evaluates the Integrated Programme of International Co-operation for the Mobilization of Personal Savings in Developing Countries and its future. Some of the topics of the selected papers are: the Asian experience with rural savings mobilization; insurance and development; case studies of savings for development in Peru, Cuba, Nigeria, and Jamaica; mobilization of savings in rural areas; and mobilization of personal savings through thrift and loan societies and self-help promotion institutions. Also available in French, Russian, and Spanish. No index.

### 380 FISCAL THEORY AND POLICY; PUBLIC FINANCE

AGELL, JONAS. *The effects of capital taxation: An equilibrium asset market approach*. Studia Oeconomica Upsaliensia series, no. 9. Uppsala, Sweden: Acta Universitatis Upsaliensis; distributed by Almqvist and Wiksell International, Stockholm, 1986. Pp. 123. Paper. ISBN 91-554-1938-0. JEL 87-0796

An analysis of the effects of capital taxation and inflation on the short-run general equilibrium of financial markets, using an asset market framework. Quantifies the parameters of the model using Swedish data for 1980 and constructs a benchmark equilibrium by employing a calibration procedure. Employs the model to simulate the effects of personal expenditure taxation, indexing the personal income tax, reforms of the corporate income tax, joint reforms of the personal and corporate income tax, and the indexation of the entire tax system on the simultaneous determination of equilibrium yields on alternative assets, the value of wealth of different classes of investors, and the incentives to invest in different production sectors. Compares the effects of these alternative tax regimes with the benchmark equilibrium. Reviews the possible impact of relaxation of some of the model's assumptions. Agell is a member of the Department of Economics, Uppsala University. No index.

BOADWAY, ROBIN W. AND MINTZ, JACK M., eds. *Policy forum on the business transfer tax*. Policy Forum series, no. 12. Kingston, Ontario: Queen's University, John Deutsch Institute for the Study of Economic Policy, 1986. Pp. iii, 72. Paper. JEL 87-0797

Eight papers from a forum sponsored by the John Deutsch Institute for the Study of Economic Policy. Evaluates the business transfer tax as an option in the reform of sales taxation in Canada and as a part of tax reform generally. The editors provide an overview of the issues surrounding the Business Transfer Tax. Glen Jenkins examines the evolution of sales tax reform in Canada and Robin Boadway discusses sales tax reform options. Jonathan Kesselman reviews the pros and cons of a business transfer tax in Canada. James Davies examines equity and efficiency aspects of such a tax. Alex Easson discusses basic considerations in designing a business transfer tax, and Jack Mintz presents issues arising from design. David Bradford provides a wrap-up to the session. Boadway and Mintz are with the Department of Economics at Queen's University. No index.

CORDRAY, DAVID S. AND LIPSEY, MARK W., eds. *Evaluation studies. Review Annual*. Volume 11. 1986. Newbury Park; London and New Delhi: Sage, 1987. Pp. 757. \$59.95. ISBN 0-8039-2569-9.

JEL 87-0798

Forty previously published papers and an introduction by the editors provide a review of the range of issues and topics that characterize the field of evaluation studies. Most of the papers were originally published in 1984 and 1985. The organizing framework distinguishes between two approaches reflected in the papers, program evaluation and program research. Six overview papers consider points of view on the history, recent developments, and critical perspectives of program evaluation and research. Seventeen papers discuss aspects of practical program evaluation such as practical utility, advice, tools, techniques, tactics, assessing benefits and costs, and qualitative inquiry. The remaining seventeen papers are program research oriented and deal with social problems and social interventions, the role of program theory, client-treatment interactions, social experimentation, and research synthesis. Cordray is Group Director, Program Evaluation and Methodology Division, U.S. General Accounting Office, Washington, D.C. Lipsey is Professor of Psychology and Chair, Psychology Department, Claremont Graduate School. No index.

GOLD, STEVEN D., ed. *Reforming state tax systems*. Denver: National Conference of State Legislatures, 1986. Pp. xiii, 352. \$20.00, paper. ISBN 1-55516-538-9.

JEL 87-0799

Nineteen papers presented at a conference sponsored by the National Conference of State Legislatures (NCSL) in Denver in October 1985. Background articles discuss recent trends and future directions of state tax policy, characteristics of a balanced and moderate state-local revenue system, and the role of research in formulating state tax policy. Part 2 addresses major concerns such as the tax burden and state tax concessions and incentives for economic development. Papers in part 3 discuss tax simplification in the context of a state tax system. Essays in part 4 examine the impact of federal tax reform on state taxes. The last part contains articles dealing with major tax sources of state revenue—personal income, general sales, business, excises, severance, death, and farms. The contributors are mainly economists, tax specialists, and government affairs experts. Gold is Director of Fiscal Studies for the National Conference of State Legislatures. Index.

LANE, JAN-ERIK, ed. *State and market: The politics of the public and the private*. SAGE Modern Politics Series, vol. 9. London; Beverly Hills and New Delhi: Sage, 1985. Pp. x, 304. \$40.00, cloth; \$16.00, paper. ISBN 0-8039-9708-6, pbk.

JEL 87-0800

Eleven papers, some presented at the European Consortium for Political Research conference in Fribourg and others written for this volume. Papers analyze the relationship between the public and private sectors, noting that the process of publicization means that citizens in the welfare state become increasingly reliant on the public budget. The papers in part 1 deal with the nature of the public sector. They examine the boundary problem of public policy and markets; public provision of goods and services; a model of a nonbudget-maximizing bureau; and economic relations between city and suburban governments. Essays in part 2 focus on public and private interaction, focusing on official, unofficial, and domestic economic resources; urban renewal, corporatism; and the housing market. Three articles in part 3 analyze the logic of public decision making. Topics are: public administration; public sector growth; and the transition of the postindustrial city. Lane is Professor of Public Administration of Umeå University. Author and subject indexes.

LEVITT, M. S., ed. *New priorities in public spending*. Joint Studies in Public Policy series, no. 13. Aldershot, England and Brookfield, Vt.: Gower, 1987. Pp. vii, 129. \$38.95. ISBN 0-566-05386-1.

JEL 87-0801

Six papers and comments presented at a conference in July 1986 organized by the U.K. National Institute of Economic and Social Research with an introduction summarizing public spending priorities by Sir Douglas Henley. Four papers consider policy areas related to public expenditure in the United Kingdom: state spending and private industry (G. White), the distributional effects on net incomes over the past two decades (Michael O'Higgins), issues pertaining to public sector pay (Chris Trinder), and the build-up of internationally determined commitments (W. J. L. Wallace). The other papers consider trends and prospects in public spending (M. S. Levitt and M. A. S. Joyce) and developments in management and control (Robin Willis). The editor is Senior Research Fellow, National Institute of Economic and Social Research, London. Index.

PICARD, LOUIS A. AND ZARISKI, RAPHAEL, eds. *Subnational politics in the 1980s: Organization, reorganization and economic development*. New York and London: Greenwood, Praeger, 1987. Pp. xi, 355. \$38.95. ISBN 0-275-08314-2.

JEL 87-0802

Thirteen papers originally presented at a symposium held at the University of Nebraska-Lincoln in November 1984 on the subject of subnational politics and the problems of intergovernmental relations in a time of scarcity. Focuses on two major themes: the concern for human participation in governmental decision making and the ability of subnational governments to cope with problems that face public-sector institutions in this time of scarcity and "cutback management." Organized into three sections: local and regional politics in federal and unitary systems (four papers), recent experiments in the reorganization of local and regional governments (five papers), the politics of development administration at the local level (four papers). Each section contains an introductory essay by the editors. Specific reference is made to systems in Canada, West Germany, Brazil, Great Britain, East Africa, and Ethiopia as well as the United States. The contributors are mainly political scientists and urban studies specialists. Picard is Associate Professor of Political Science, University of Nebraska-Lincoln. Zariski is Professor of Political Science, University of Nebraska-Lincoln. Index.

REIS, KARL EUGEN. *Fesseln für den Leviathan: Die Steuerrevolte in den Vereinigten Staaten und die Problematik budgetärer Schranken*. Reihe Wirtschaftswissenschaften, Band 32. Pfaffenweiler: Centaurus-Verlagsgesellschaft, 1987. Pp. xi, 338. Paper. ISBN 3-89085-159-2. JEL 87-0803

Text in German, with an English summary. Deals with circumstances under which a collective resistance to taxation takes place. Examines the causes that led to the U.S. tax revolt in 1978. Discusses whether such fiscal revolts are the appropriate means for expressing public preferences. Gives special attention to Proposition 13 in California, describing the factors behind this movement. Though many causes are indicated, the high and growing burden of visible levies (property tax) is presented as the main issue. Examines assumptions behind fiscal constraint. Recognizes conflicts between public preferences and special interest groups. Favors debt limitations as a technique for abolishing the negative impact of deficits, but recognizes that politicians oppose constraints as these limit their own behavior. Index.

#### 400 International Economics

GANDOLFO, GIANCARLO. *International economics*. New York; Berlin; London and Tokyo: Springer,

1986. Pp. irregular. \$137.00. ISBN 0-387-16707-2. JEL 87-0804

Undergraduate and graduate textbook in international economics; the text is directed to undergraduate students and appendices to more advanced and graduate students. Treatment in the text is mainly confined to graphic analysis and elementary algebra and assumes a good knowledge of basic micro- and macroeconomics; treatment in the appendices is mainly mathematical and assumes a working knowledge of calculus, matrix algebra, optimization methods, and dynamic analysis for stability purposes. The first section presents the pure theory of international trade. Topics include: the classical theory of comparative costs; neoclassical theory of international trade; the Heckscher-Ohlin model; tariffs, protection, and economic integration; international trade and economic growth; refinements of the orthodox theory; and new theories of international trade. The second section addresses international monetary theory and open economy macroeconomics. Some topics are: the foreign exchange market, balance of payments and national accounts, the roles of income changes and exchange rates in the adjustment process, money and other assets under fixed and flexible exchange rates, international capital movements, fixed versus flexible exchange rates, international liquidity and international financial markets, and the problem of integration between the pure theory of international trade and international monetary economics. Gandolfo teaches international economics at the University of Rome. Bibliography; name and subject indexes.

NOSSITER, BERNARD D. *The global struggle for more: Third world conflicts with rich nations*. Twentieth Century Fund Essay series. New York; London; São Paulo and Sydney: Harper and Row, 1987. Pp. xvi, 254. \$20.00. ISBN 0-06-435851-8. JEL 87-0805

Examines issues dividing rich and poor nations. Contends that third world growth is linked closely to prosperity in the developed world. Reviews the history of lending and the return to the lenders. Traces the rising South, attempts by the IMF and other groups to alleviate the effects of the debt crisis, the attempt to develop laws relating to mineral and fishing rights in the sea, and the nature of aid programs. Analyzes measures to ease the debt crisis. Concludes that strong Northern growth will solve many of the South's problems, especially low commodity prices and demand. Nossiter is a journalist trained in economics. Index.

SALVATORE, DOMINICK. *International economics*. Second edition. New York: Macmillan; London: Col-

lier Macmillan, [1983] 1987. Pp. xxviii, 611. ISBN 0-02-405360-0. JEL 87-0806

Second edition of an introductory textbook on the theory and principles of international economics. Designed for use in both undergraduate and graduate courses. New topics include: the specific-factors model, growth with factor immobility, trade in differentiated products, the rise of trade protectionism, the international debt, exchange-rate dynamics, exchange-rate futures and options, efficiency of the foreign exchange markets, the Eurobond and Euronote markets, and the portfolio balance approach. Each chapter contains a summary, glossary, readings and questions, and problems. Contains answers to selected problems. Instructor's manual available. [For annotation of previous edition see JEL no. 83-0415.] Salvatore is Chairman and Professor, Department of Economics, Fordham University. Glossary, name, and subject indexes.

TREMBLAY, RODRIGUE, ed. *Issues in North American trade and finance: Fourth International Congress. Papers and Proceedings*, vol. 4, no. 1. Montreal: North American Economics and Finance Association, 1987. Pp. xiv, 633. Paper. ISBN 2-920657-99-1. JEL 87-0807

Thirty-nine papers presented at the Fourth International Congress of the North American Economics and Finance Association in July 1986 at the University of Montreal consider important issues pertaining to the economics of Canada, Mexico, and the United States. General topic areas are: international indebtedness (eleven papers), money and foreign exchange (eight papers), banking and financial markets (five papers), trade and competitiveness (eleven papers), and corporate finance and management (four papers). Authors are economists, agency representatives, financial executives, and other financial specialists. The editor is at the University of Montreal. Index.

VISSE, HANS AND SCHOORL, EVERT, eds. *Trade in transit: World trade and world economy—Past, present and future*. Hingham, Mass.; Dordrecht and Lancaster: Kluwer Academic, 1987. Pp. xvii, 338. \$47.50. ISBN 90-247-3305-7. JEL 87-0808

Papers presented at the World Trade Conference 1985, held on 4-6 September, organized by the World Trade Center Amsterdam, the University of Amsterdam, and the Free University of Amsterdam on the occasion of the opening of the Trade Center. Twenty-six papers are divided into six parts as follows: (1) historical, with papers dealing with the classical and Marxian view of peace and trade; (2) the global view, including essays on the

financial conditions for sustaining recovery, lessons from the past about world trade and international finance, the influence of international capital flows on world trade, high-tech and the changing shape of world trade, long-term issues in international equilibrium, and trends in world protectionism; (3) U.S. policy and the dollar, describing the U.S. economy in transition, the role of U.S. domestic economic and financial policy in the world economy, exchange stability, and surveillance over exchange rate policies; (4) groups of countries, concerned with North-South relations, countertrade, barter, East-West trade, the EMS and trade, the viability of the ECU, and the Pacific Basin; (5) business firms on the world market, with papers on the past and future of the trading company and success factors for the development of international trading; and (6) special topics, covering the role of the consumer in world trade, export financing from a Keynesian view, and international trade and the resurgence of Islam. Contributors are economists, bankers and businessmen. Visser is Professor of Money and Banking and International Economics at the Free University in Amsterdam. Schoorl is Senior Lecturer in Economics at the University of Amsterdam. No index.

#### 410 INTERNATIONAL TRADE THEORY

CHICHILNISKY, GRACIELA AND HEAL, GEOFFREY. *The evolving international economy*. Cambridge, New York and Melbourne: Cambridge University Press, 1986. Pp. viii, 156. \$29.95. ISBN 0-521-26716-1. JEL 87-0809

Focuses on the main issues of trade and development and the attainment of major development goals generally espoused by the international community, i.e., rapid development in the third world, sustained economic expansion in the industrial countries, and the eradication of deep inequalities and extreme poverty. Traces the way markets respond to policies, both at the domestic and international levels. Main topics include: the recurrence of recession, the persistence and severity of unemployment in many industrial countries, and the emergence of protectionism and managed trade; the emergence of new technologies that lead to structural changes in domestic and international markets and challenge existing institutional arrangements and trading patterns; the changing international environment facing the developing countries, and especially issues of international debt, export strategies, and North-South trade in armaments; the pricing of exhaustible resources, including oil; and perceived limitations of existing international financial institutions and the impact

of declining transfers of wealth from industrial to developing countries. The last part of the book presents economic models and arguments to substantiate the previous discussion. The first version of the book was used in the preparation of material for UNCTAD VI. Chichilnisky and Heal are Professors of Economics, Columbia University. No index.

UNITED NATIONS INDUSTRIAL DEVELOPMENT ORGANIZATION. *International comparative advantage in manufacturing: Changing profiles of resources and trade*. UNIDO Publication Sales No. E.85.II.B.9. Vienna: Author, 1986. Pp. xii, 226. \$17.00, paper. ISBN 92-1-106210-1. JEL 87-0810

Based on the premise that international comparative advantage is an important determinant of production and trade in manufacturing, clarifies policy issues relating to world trade and industrial restructuring. Based on data for all manufacturing activities in a wide range of countries between the early 1960s and early 1980s. Focuses on a statistical description, an empirical analysis, and a policy-relevant interpretation of structures and trends. Annexes present data on patterns of revealed comparative advantage and their changes for a wide range of products for forty-one countries between 1970-72 and 1981-83, showing both exports and imports and revealed comparative advantage. Analysis focuses on the relationship between comparative advantage and resource endowment and changes in patterns of international competitiveness with reference to product cycle dynamics of international trade and sequential stages of comparative advantage in a country's economic development. No index.

#### 420 TRADE RELATIONS; COMMERCIAL POLICY; INTERNATIONAL ECONOMIC INTEGRATION

CONNOLLY, MICHAEL AND GONZÁLEZ-VEGA, CLAUDIO, eds. *Economic reform and stabilization in Latin America*. New York and London: Greenwood Press, Praeger, 1987. Pp. xxiii, 348. \$47.50. ISBN 0-275-92307-X. JEL 87-0811

Seventeen papers resulting from the Second Dominican Republic Conference on Trade and Financial Liberalization in Latin America held in Santo Domingo in March 1985. Papers analyze the historical record of economic liberalization experiments in Latin America and the Caribbean. Three papers focus on the theory behind such experiments. Two papers consider the order of trade and financial liberalization. Five papers discuss the appropriate exchange rate regime with reference to Chile and Mexico, the economics of the Dominican Republic,

and the liberalization experience of Chile and Uruguay. Three papers examine the impact of trade liberalization and preferential agreements on U.S. imports, financial reform with a flexible exchange rate, and the interest rates, transactions costs, and financial savings associated with financial liberalization. The final two papers consider employment in a financially suppressed economy and government revenue from money creation in Latin America, 1977-81. The contributors are mainly economists. Connolly is Professor of Economics, University of South Carolina. González-Vega is Professor of Economics and Agricultural Economics, Ohio State University. No index.

ECONOMIC COMMISSION FOR LATIN AMERICA CONFERENCE (ECLAC). *Trade relations between Brazil and the United States*. With the collaboration of SIDNEY WEINTRAUB. Estudios e Informes de la CEPAL, no. 52. Santiago, Chile: United Nations with the cooperation of the Institute for Economic and Social Planning (IPEA), Brazilia, 1985. Pp. 154. \$6.00, paper. ISBN 92-1-121123-9. JEL 87-0812

Analysis of commercial relations between Brazil and the United States. Reviews trends in U.S. trade policy in recent years, the role of different government agencies, and the impact on trade policy of conflicting demands for free trade and protectionism. Examines recent trends in Brazil's trade policy and highlights the main elements of its export promotion program. Discusses the form and content of trade between Brazil and the United States. Outlines the General System of Preferences employed by the U.S. and the various forms of import restrictions facing Brazil. Analyzes the sources of tension in U.S.-Brazil trade relations and presents recommendations for resolving trade conflict. Bibliography; no index.

FINDLAY, CHRISTOPHER AND GARNAUT, ROSS, eds. *The political economy of manufacturing protection: Experiences of ASEAN and Australia*. Sydney; London and Boston: Allen and Unwin, 1986. Pp. xxiii, 299. Paper. ISBN 0-04-330378-1. JEL 87-0813

Eleven papers, sponsored by the ASEAN-Australia Economic Relations Research Project, present new material on a range of matters related to protection in Australia and the ASEAN countries, with major focus on the extent and structure of manufacturing protection. Several papers examine the historical and statistical materials to determine why protective sentiment persists and analyze recent attempts at trade liberalization. Others review effects of protection on ASEAN-Australia trade in manufacturing. The first six papers are devoted

to a description of the origin, rationale, and current structure of protection in Indonesia, the Philippines, Thailand, Malaysia, Singapore, and Australia. Other topics are: a general equilibrium analysis of the effects of protection on the region as a whole; analysis of the effects of import quotas and voluntary export restraints, including licensing; the effects of Australian protection on imports from ASEAN; and how protection came about, why it persists, and how trade can be liberalized to promote economic growth. The contributors are mainly economists. Findlay is with the Economics Department, University of Adelaide. Garnaut is a member of the Economics Department, Research School of Pacific Studies, Australian National University. Bibliography; index.

GHANEM, SHUKRI. *OPEC: The rise and fall of an exclusive club*. London; New York and Sydney: KPI; distributed by Methuen Inc., Routledge and Kegan Paul, N.Y., 1986. Pp. x, 233. \$59.95. ISBN 07103-0175-8. JEL 87-0814

A history of the rise and fall from power of OPEC. Reviews the nature of the world oil industry before the formation of OPEC, the pattern of price setting, and the first Arab petroleum congress. Describes the birth of OPEC, and its membership and members. Reviews the objectives of OPEC during its first decade, 1960-70; the policies employed to increase the price of, and income from, oil, and the nature of participation and solidarity during this period. Analyzes in detail the years of change and the ascendance to power during OPEC's second decade. A final section discusses the reasons for and process of decline of OPEC power. Ghanem is Chief Economist at the National Academy of Scientific Research, Tripoli, Libya. Index.

KRAUS, WILLY AND LÜTKENHORST, WILFRIED. *The economic development of the Pacific Basin: Growth dynamics, trade relations and emerging cooperation*. New York: St. Martin's Press; London: Hurst, 1986. Pp. x, 180. \$32.50. ISBN 0-312-00453-4. JEL 87-0815

An analysis of economic development and cooperation in the Pacific Basin countries. Examines the present crisis in global trade policy and the possibility of reforming GATT. Discusses the basic trade policy issues among the Pacific developing countries and Japan in terms of the import restriction and export promotion measures adopted by Southeast Asian countries and the controversy regarding Japan's trade policy. Analyzes various concepts of institutionalized economic cooperation in the world economy and the Pacific Basin, reviews the nature of economic interdependence among

countries in this region, and outlines the views of the U.S. and ASEAN countries regarding increased cooperation. Kraus is Professor Emeritus and associated with the Institute for Development Research and Development Policy at the Ruhr University, Bochum, West Germany. Lütkenhorst is associated with the United Nations Industrial Development Organization in Vienna. Bibliography; index.

LEYTON-BROWN, DAVID, ed. *The utility of international economic sanctions*. New York: St. Martin's Press, 1987. Pp. 320. \$32.50. ISBN 0-312-00369-2. JEL 87-0816

Fifteen papers originally presented at a conference on the utility of economic sanctions as a policy instrument at York University in Toronto in March 1983. The papers systematically and comparatively analyze major cases of the imposition of international economic sanctions in peace-time conflict situations in the post-World War II years. Part 1 (two papers) examines the application of sanctions by the League of Nations and the United Nations as well as U.N. sanctions against South Africa and Rhodesia. Part 2 (four papers) discusses Western economic sanctions in East-West conflicts. Part 3 (two papers) considers the Arab boycott of Israel and the 1973 Arab oil embargo of the United States. Part 4 (two papers) examines the consequences of the initiators of the 1980-81 grain embargo of the U.S.S.R. and of the Siberian gas pipeline sanctions in 1981-82. Part 5 (three papers) investigates the impact of economic sanctions on third parties and part 6 (two papers) draws conclusions about the use of sanctions and offers policy prescriptions for their effective design and implementation. The contributors are mainly political scientists. Leyton-Brown is Associate Professor of Political Science and Associate Director of the Research Programme in Strategic Studies, York University, Toronto. Subject index.

MCMILLAN, CARL H. *Multinationals from the second world: Growth of foreign investment by Soviet and East European enterprises*. New York: St. Martin's Press for the Trade Policy Research Centre, London, 1987. Pp. xvi, 290. \$29.95. ISBN 0-312-53253-X. JEL 87-0817

Analysis of foreign direct investment from the Council for Mutual Economic Assistance (Comecon) countries. Examines whether Comecon-based enterprises were responding to similar stimuli in a manner analogous to other multinational enterprises, and examines the role of foreign direct investment in the development of the economic policy of Comecon countries. Outlines the policy context within which foreign investment activities

have been pursued in Comecon countries and the trends and patterns of direct foreign investment. Examines the motivation for, and process of, direct foreign investment in different Comecon countries. Analyzes the nature and experience of investments in the service sector, in production facilities, and in four developed and developing countries. Concludes by noting certain recent trends, issues, and prospects. McMillan is Professor of Economics at Carleton University, Ottawa. Glossary; bibliography; company and subject indexes.

STERN, ROBERT M., ed. *U.S. trade policies in a changing world economy*. Cambridge, Mass. and London: MIT Press, 1987. Pp. 437. \$25.00. ISBN 0-262-19253-5. JEL 87-0818

Nine essays and comments originating at a conference on international trade and trade policies at the University of Michigan. Focus is on trade policy in a world undergoing serious structural changes and witnessing a growing increase in the U.S. trade deficit. Topics of the papers are: an overview of current issues in trade policy; analysis of the macro- and microeconomic setting in which U.S. trade policy has taken place; a model of endogenous protection to help search for the variables that could explain protectionist sentiment in the United States since 1900; strategic sectors and international competition; the U.S. response to trade policies of other countries, emphasizing effects on U.S. national income and security; trade policy as foreign policy since 1785; the national defense argument on behalf of protectionism; multilateral and bilateral negotiating approaches for the conduct of U.S. trade, policies; and a set of rules that may be desirable to set the parameters for trade policies. The contributors are economists. Stern is Professor of Economics and Public Policy at the University of Michigan. Subject and name indexes.

TUSSIE, DIANA. *The less developed countries and the world trading system: A challenge to the GATT*. Studies in International Political Economy series. New York: St. Martin's Press, 1987. Pp. viii, 162. \$29.95. ISBN 0-312-48158-6. JEL 87-0819

Examines the manner in which less developed countries (LDCs) have reacted to the world trading order as reflected in the General Agreement on Tariffs and Trade (GATT). Reviews the origins and history of GATT; outlines the challenges mounted by LDCs against their exclusion from world trade and the reform of GATT; and analyzes the main developments in the structure of international trade since World War II in order to highlight their effect on the position of LDCs in GATT. Ex-

fibre agreement and the performance of attempts at regional economic integration in Latin America. Concludes that while the GATT provided legitimacy and confidence, it is not responsible for the LDC's unsatisfactory performance or growth in trade. Tussie is Chief of the Foreign Trade Department at the Planning Secretariat in Argentina. Bibliography; index.

UNITED NATIONS CONFERENCE ON TRADE AND DEVELOPMENT. *Current problems of economic integration: The problems of promoting and financing integration projects*. U.N. Sales No. E.86.II.D.1. New York: United Nations, 1986. Pp. viii, 115. \$13.50, paper. ISBN 92-1-112216-3. JEL 87-0820

Part 1 contains the report of the meeting of secretariats of economic cooperation and integration groupings of developing countries and multilateral development finance institutions in Geneva in June 1984 to examine the problems of promoting and financing integration projects. Its recommendations pertain to preinvestment funds for integration projects and their promotion, financing of such projects, and guarantee requirements. Part 2 consists of a paper by H. T. Adams, an UNCTAD consultant, on the evolution of the problem of guaranteeing loans for integration projects of developing countries; it examines statutory requirements, the scope and usefulness of state guarantees, guarantees and the multilateral institutions of industrialized countries, and developments within multilateral development institutions and includes a sample loan agreement. Part 3 is a paper by the UNCTAD Secretariat on recent issues and meetings related to the promotion and financing of integration projects of developing countries; it reviews existing integration projects of economic cooperation and integration groupings and discusses project identification and promotion, financial resources, terms and conditions of financing projects, and coordination and mobilization of international support. Also available in French, Russian, and Spanish. No index.

UNITED NATIONS DEPARTMENT OF INTERNATIONAL ECONOMIC AND SOCIAL AFFAIRS, STATISTICAL OFFICE. *Classification by broad economic categories: Defined in terms of SITC, Rev. 3*. Statistical Papers, Series M, no. 53, Rev. 2. U.N. Publication Sales No. E.86.XVII.24. New York: United Nations, 1986. Pp. x, 68. \$8.50, paper. ISBN 92-1-161276-4. JEL 87-0821

Presents a classification of national and external trade statistics based on the main end-use of commodities traded internationally, which can be gen-

of National Accounts, i.e., capital, intermediate, and consumer goods. The classification is based on the following broad economic categories (BEC): food and beverages (primary and processed); industrial supplies not elsewhere specified (primary and processed); fuels and lubricants (primary and processed); capital goods (except transport equipment), and parts and accessories; transport equipment and parts and accessories; consumer goods not elsewhere specified (durable, semi-durable, and nondurable); and goods not elsewhere specified. Also available in French, Russian, and Spanish. No index.

UNITED NATIONS ECONOMIC COMMISSION FOR EUROPE. *Bulletin of statistics on world trade in engineering products, 1984*. U. N. Publication Sales no. E/F/R.86.II.E.10. New York: United Nations, 1986. Pp. 407. \$38.00, paper. ISBN 92-1-016193-9.

JEL 87-0822

Examines the flow of engineering products in world trade. Commodity distribution for most countries is based on the Standard International Trade Classification, Revision 2. Engineering products are defined to include machinery and transport equipment; manufactures of metals; professional, scientific, and controlling instruments and apparatus; photographic apparatus and optical goods; and watches and clocks. Data cover exports of thirty-six countries, representing approximately 98 percent of the world trade in these commodities. Statistics are compiled from replies to questionnaires supplied by various countries and from official national sources. Most data are for 1984, with summary tables going back to 1963. Data are expressed in millions of current U.S. dollars in a f.o.b. basis. Table of contents, explanatory notes, country and commodity lists, and table notes are in English, French, and Russian. No index.

UNITED NATIONS INDUSTRIAL DEVELOPMENT ORGANIZATION. *Regional industrial co-operation: Experiences and perspectives of ASEAN and the Andean pact*. UNIDO Publication Sales No. E.85.II.B.5. Vienna: Author, 1986. Pp. xi, 102. Paper. ISBN 92-1-106304-7.

JEL 87-0823

Consolidates the major findings of a series of studies and of the Association of South-East Asian Nations/Andean Pact Conference Study Tour on Regional Industrial Co-operation. Argues that the net benefits of regional economic cooperation or integration schemes among developing countries no longer can be analyzed within the neoclassical economic framework, but should be understood in a broader institutional context. Proposes that industrial cooperation is the key to the continuing growth of intraregional trade and to a region's suc-

cess in its overall industrialization effort. Examines industrial cooperation within the Association of South-East Asian Nations, focusing on trade and industrial development, industrialization strategies, techniques of economic cooperation, trade liberalization and cooperation in practice. Reviews Andean Pact industrial cooperation, discussing the objectives and framework of the Pact, industrial development, common external tariffs, trade liberalization, industrial programs, foreign investment policy, financial and technological cooperation, and integration. Provides a prospective analysis on selected issues, including obstacles to regional cooperation, treatment of less developed member countries, the roles of foreign investment and the private sector, and extraregional cooperation. Concludes with proposals for action and future research. No index.

WINBERG, ALAN R. *Managing risk and uncertainty in international trade: Canada's natural gas exports*. Boulder, Colo. and London: Westview Press, 1987. Pp. xv, 288. \$29.95, paper. ISBN 0-8133-7150-3.

JEL 87-0824

Analysis of Canada's natural gas exports as part of a study of the management of risk and uncertainty in international trade in raw materials. Outlines trends in natural gas exports and the development of Canada's natural gas industry. Reviews Canada's natural gas export policy and evaluates it in light of its objectives and of dependency theories of economic development. Examines the role of uncertainty in the policy-making process as well as the impact of substitutes on the price of natural gas and the overall demand for energy. Delineates the role of the National Energy Board, trends in export prices, policies for protection of domestic requirements for natural gas, and outlines certain alternative regulatory mechanisms. Winberg is Assistant Director of the Program Evaluation Division of the Department of Consumer and Corporate Affairs of the government of Canada. Bibliography; index.

WONNACOTT, PAUL. *The United States and Canada: The quest for free trade, an examination of selected issues*. With an appendix by JOHN WILLIAMSON. Policy Analyses in International Economics series, no. 16. Washington, D.C.: Institute for International Economics, 1987. Pp. xii, 173. \$10.00, paper. ISBN 0-88132-056-0.

JEL 87-0825

Argues that bilateral free trade would confer substantial economic benefits to both the United States and Canada, contributing to their efficiency and international competitiveness. Presents data depicting the dollar value of U.S.-Canadian trade and its present status and possible future poten-

tials. Discusses the various negotiation topics—tariffs, nontariff barriers, trade remedy laws, services, investment, and exchange rates. Analyzes the sources of gain, intra- and interindustry adjustment, and effects of bilateral free trade on the United States. Reviews the nature of opposition and why certain issues will not die. Explains why trade remedy laws are an area where agreement may be difficult. Suggests possible coverage of a free trade accord. Williamson's appendix discusses fundamental equilibrium exchange rates. Wonnacott is Professor of Economics at the University of Maryland. No index.

#### 430 OPEN ECONOMY MACROECONOMICS; EXCHANGE RATES; INTERNATIONAL FINANCE

ALIBER, ROBERT Z., ed. *The reconstruction of international monetary arrangements*. New York: St. Martin's Press, 1987. Pp. vii, 330. \$32.50. ISBN 0-312-66590-3. JEL 87-0826

Fourteen conference papers and an introduction by the editor assess current international monetary arrangements and consider some of the alternatives. Papers focus on options to the system of floating exchange rates and the adequacy of international reserves and lender-of-last-resort arrangements in the international system. Five papers examine recent experiences—past plans and the optimality of the evolving international monetary system, unexpected real consequences of floating exchange rates, a more orderly exchange-rate system, the wage and price adjustment process in six large OECD countries, and the arguments for fixed or flexible exchange rates or a mixture of the two systems. Nine papers consider topics related to international reserves and money, including: an internationally managed money supply, changing perceptions of money and reserves in the world economy, gold as a viable basis for the monetary system, options for gold, gold monetization and discipline, the management of the currency composition of reserve assets and external liabilities of developing countries, the theory of lender of last resort and the Eurocurrency markets, and the endogeneity of international liquidity. The contributors are mainly economists. Aliber is Professor of International Economics and Finance, University of Chicago. Index.

ARTIS, MICHAEL AND OSTRY, SYLVIA. *International economic policy coordination*. Chatham House Papers series, no. 30. London and New York: Routledge and Kegan Paul, 1986. Pp. 89. \$10.95, paper. ISBN 0-7102-0699-8. JEL 87-0827

Examines international economic interdependence and the case for greater international economic policy coordination. Discusses the nature of linkages between economies and arguments for, as well as obstacles and qualifications of, greater policy coordination. Recounts the history of the construction, functioning, and collapse of the institutions of Bretton Woods. Considers the experience of the floating exchange-rate era beginning in the early 1970s and the promptings its deficiencies have provided for more coordinated policy. Reviews the recent record of the summits and the nature of the Group of Five initiatives and concludes that a realistic way to closer cooperation exists through a combination of the summit, a framework of national money-income targeting, and policy responses conditioned on exchange-rate promptings. Artis is Professor of Economics, University of Manchester. Ostry is ambassador for multilateral trade negotiations and personal representative of the Prime Minister of Canada for the economic summit. No index.

BHANDARI, JAGDEEP S. *Studies in international macroeconomics*. New York and London: Greenwood Press, Praeger, 1987. Pp. vi, 273. \$49.95. ISBN 0-275-92067-9. JEL 87-0828

Uses a model-building approach to study selected policy-related problems in open economies and illustrates issues of international macroeconomics. The models are discrete-time models that rely on equilibrium methods and the rational expectations hypothesis. Issues examined include: wage contracting and exchange-rate management, i.e., wage indexation-exchange intervention policy; the effect of externally occurring input price disturbances on oil-importing economies; finite (imperfect) capital mobility and the stability of a small open economy; the relationship between the economic size of a country and its degree of vulnerability to externally occurring disturbances; implications of alternative informational regimes for the transmission properties of various structural disturbances and for the selection of an optimal exchange-rate policy stance; macroeconomic determinants of a flexible-exchange currency composite policy; two-tier exchange-rate regimes; and the effects of leakage between commercial and financial exchange markets on the properties of dual exchange-rate models as well as export versus import leakage. Bhandari is Associate Professor of International Economics, West Virginia University. Index.

BIRD, GRAHAM. *International financial policy and economic development: A disaggregated approach*. New York: St. Martin's Press, 1987. Pp. xvi, 348. \$37.50. ISBN 0-312-42213-X. JEL 87-0829

Focuses on the international problems of developing countries and the ways in which international financial policy might be used to help alleviate them. Identifies and analyzes some of the principal issues involved in discussing international financial policy from the standpoint of the developing world related to the IMF's relationship with the developing world. Examines the extent to which it is legitimate to treat LDCs as a special case and presents a historical and empirical picture of their position. Covers questions of IMF conditionality, lending facilities, interest rate subsidies, financing of its activities, and the problem of commodity price stabilization. Discusses the SDR facility and ways in which this might be modified to the advantage of LDCs as well as questions of more relevance to NICs, i.e., aspects of private lending. General conclusions are that the scope for reform that does not rely on the compliance of the North is limited, that there is considerable scope for reform that would be beneficial to the developing world in terms of relaxing its balance-of-payments constraints, and that many developing countries can make a strong case that they warrant special treatment. Bird is Senior Lecturer and Course Director in Economics, University of Surrey. Index.

COOPER, RICHARD N. *The international monetary system: Essays in world economics*. Cambridge, Mass. and London: MIT Press, 1987. Pp. xvii, 286. \$27.50. ISBN 0-262-03124-8. JEL 87-0830

Thirteen papers, most previously published, discuss issues relevant to the international monetary system. One paper surveys possible types of international monetary regimes, while three others evaluate different monetary systems: the gold standard, a system with gliding parities, and flexible exchange rates. Papers discuss alternative mechanisms of adjustment to disturbances in the system of international payments, IMF supervision of floating exchange rates, and the role of national currencies in the international monetary system, with special reference to the U.S. dollar. Other essays examine the future role of the SDR, evaluate the international monetary system during the 1980s, and assess the possibility of the evolution of the IMF into a world central bank. Cooper is Maurits C. Boas Professor of International Economy at Harvard University. Subject and name indexes.

CRCKETT, ANDREW AND GOLDSTEIN, MORRIS. *Strengthening the international monetary system: Exchange rates, surveillance, and objective indicators*. Occasional Paper series, no. 50. Washington, D.C.: International Monetary Fund, 1987. Pp. vii,

84. \$7.50, paper. ISBN 0-639934-76-0.

JEL 87-0831

Discusses issues arising out of reports on the international monetary system prepared in 1985 by the Group of Ten and the intergovernmental Group of Twenty-Four on International Monetary Affairs. Presents a review and assessment of floating exchange rates. Identifies and discusses issues and proposals for improving the functioning of the system, reviewing both areas of agreement and contention. Suggests improving exchange rate stability through better discipline and coordination of macroeconomic policies among the major nations, establishment of target zones for exchange rates, and strengthening the existing system. Discusses surveillance over exchange-rate policies. Reviews indicators of policies and economic performance to give quantitative content to governments' economic aims and achievements, thereby improving judgment as to the reality of objectives. Crockett and Goldstein are with the IMF. No index.

DEHOVE, MARIO AND MATHIS, JEAN. *Le système monétaire international (The international monetary system)*. Sciences économiques. Paris: Dunod; distributed in North America by Diffulivre, Montreal, 1986. Pp. 272. Fr 165.00; Can\$ 32.50, paper. ISBN 2-04-016523-1. JEL 87-0832

The authors propose a general introduction to the principles and the practice of the postwar international monetary system. Following the first two chapters on the theoretical and institutional aspects, the remaining four chapters depict a chronological analysis of the main events and their implications for different classes of nations, particularly in the third world. Dehove is a researcher at the I.R.E.S. (Paris) and Mathis is a professor at Paris-XIII. The study was sponsored by the Institut de Recherches Economiques et Sociales. Bibliography; no index. [Jean Mirucki]

HALLWOOD, PAUL AND MACDONALD, RONALD. *International money: Theory, evidence and institutions*. With contributions from ROBERT SHAW. Oxford and New York: Blackwell, 1986. Pp. viii, 279. \$49.95, cloth; \$19.95, paper. ISBN 0-631-14446-3, pbk. JEL 87-0833

An introductory textbook on international monetary economics. Outlines the traditional theory of exchange-rate determination and discusses the problems of macroeconomic management in an open economy. Reviews the theory and evidence on purchasing power parity and presents an alternative monetary approach to the balance of payments. Examines the concepts of the exchange rate as an asset price and assesses the policy implications of such views. Analyzes the portfolio balance

approach to exchange-rate determination and reviews the evidence for the efficient markets hypothesis in the determination of spot and forward exchange rates. Discusses certain recent international monetary arrangements, the Eurocurrency system, the role of the IMF in the third world, the nature and problems of international debt, and the European Monetary System. Hallwood is Senior Lecturer and MacDonald is Lecturer in the Department of Political Economy at the University of Aberdeen. Index.

- HORII, AKINARI. *The evolution of reserve currency diversification*. BIS Economic Papers series, no. 18. Basle: Bank for International Settlements, Monetary and Economic Department, 1986. Pp. 62. Paper. JEL 87-0834

Analyzes trends in reserve currency diversification and international trade since the early 1970s through the end of 1984 in the United States, West Germany, Japan, the other industrial countries, the oil-exporting developing countries, and the nonoil exporting countries. Examines exchange-rate arrangements, floating exchange rates, portfolio management, transactions balances, liquidity, and inertia. A principal finding is that reserve diversification has been limited by the extent to which reserves are held as transactions balances. Concludes that the future course of reserve diversification will depend not only on the relative performance of reserve currencies on the exchange markets but also on the liquidity features of these currencies and the level of international reserves in relation to reserve needs. Bibliography; no index.

- INTERNATIONAL MONETARY FUND. *Balance of payments statistics*. Volume 37. Yearbook, Parts 1 and 2. Washington, D.C.: Author, 1986. Pp. 756; xiii, 131. \$12.00, paper. ISSN 0252-3035. JEL 87-0835

Two-part annual yearbook containing available balance-of-payments statistics for 142 countries from 1978 through 1985; compiled in accordance with the International Monetary Fund's 1977 Balance of Payments Manual and based mainly on reports sent to the fund by member countries. Part 1 contains country sections composed of aggregated presentations of yearly and recent quarterly transactions data and detailed presentations of yearly transactions and stock data. Part 2 aggregates the data according to balance-of-payments categories for individual countries, country groups, and all countries. Data are available on computer tape. The introductory information is also presented in French and Spanish. [For annotation of volume 35 see JEL no. 85-0484.] No index.

- INTERNATIONAL MONETARY FUND, RESEARCH AND TREASURER'S DEPARTMENT. *The role of the SDR in the international monetary system: Studies by the Research and Treasurer's Departments of the International Monetary Fund*. Occasional Paper series, no. 51. Washington, D.C.: International Monetary Fund, 1987. Pp. vii, 82. \$7.50, paper. ISBN 0-939934-81-7. JEL 87-0836

A review of the role of the Special Drawing Right (SDR) in the international monetary system and changes in the role of the SDR, providing a comparative analysis of the SDR and European Currency Unit (ECU) through 1986. Part 1 sketches the implications of changes in the international monetary system for the role of the SDR, discussing the shortcomings of the gold exchange standard, asymmetries in reserve creation, the contributions of the SDR, insufficient liquidity, falling confidence in the gold convertibility of the principal reserve currency, and views on the role of the SDR. Also examines whether there is a potential role for the SDR in the evolving international monetary system and the possible extension in the stability role of the SDR. Part 2 consists of a comparative analysis of the characteristics and functioning of the ECU and SDR in both official and private circles with reference to unit of account, valuation, supply, demand, and distributional effects. Two appendices give details about the structure and nature of the ECUs and SDRs. Bibliography; no index.

- LOONEY, ROBERT E. *The Jamaican economy in the 1980s: Economic decline and structural adjustment*. Westview Special Studies on Latin America and the Caribbean. Boulder, Colo.: Westview, 1987. Pp. xiii, 257. \$22.50, paper. ISBN 0-8133-7055-8. JEL 87-0837

Provides a quantitative assessment of the main internal and external causes of deterioration in the Jamaican economy since 1972 and assesses the prospects for returning to a period of stable growth under an IMF stabilization program. Examines factors leading to the deterioration of the balance of payments on current account and questions whether the Jamaican economy is a prototype for application of IMF stabilization packages. Assesses whether the application of the small open country model is appropriate in the case of Jamaica, given information on the macroeconomic consequences of the size and typologies of other developing countries. Develops a macroeconomic model to determine the extent to which economic performance could have been improved in the 1970s through alternative policy packages. Also considers the current government's structural adjustment program and potential impact of the Caribbean Basin Initia-

tive. Concludes that both internal and external factors caused Jamaica's economic decline, that the government's supply-side policies are basically correct, and that the size of the public sector should be reduced. Looney is Associate Professor of National Security Affairs, U.S. Naval Postgraduate School, Monterey. No index.

MANOULIS, DIMITRIS. *Economic development and the structure of the balance of payments: The case of Greece*. Centre of Planning and Economic Research Studies series, no. 18. Athens: Centre of Planning and Economic Research, 1986. Pp. 267. Paper. JEL 87-0838

Argues that financial transfers from abroad have important structural effects for the domestic economy of a small, open economy such as Greece and that institutional and organizational bottlenecks affect the cost of adjustment and the optimal savings and investment functions. Analyzes the effects of institutional and organizational constraints faced by developing countries on their processes of savings and investment. Examines possible stages of the balance of payments of a developing country and the optimal amounts of international borrowing or lending. Describes the Greek economy and the effects of economic policy, a monetary model of financial transfers to a developing country, and the case of tourism as an example of a booming sector and structural problems. The dynamic analysis examines the demand for investment and the supply of savings in a developing economy, the structure of the balance of payments, and the optimal current account balance. Ph.D. dissertation granted by the University of Essex (1984). Manoulis is Research Associate at the Centre of Planning and Economic Research. No index.

UNGERER, HORST, ET AL. *The European monetary system: Recent developments*. IMF Occasional Paper series, no. 48. Washington, D.C.: International Monetary Fund, 1986. Pp. vii, 75. \$7.50, paper. ISBN 0-939834-79-5. JEL 87-0839

Reviews developments in the European Monetary System (EMS) from the beginning of 1983 to August 1986. Complements and updates an earlier paper by the same authors (IMF Occasional Paper, no. 19, 1983). Discusses membership in the EMS and changes in its operation and institutional design. Summarizes exchange-rate developments, analyzes the variability of exchange rates in the EMS from 1979 to 1985, and compares it with earlier periods and with the experience outside the EMS. Examines price, monetary, fiscal, external current account, and real sector developments in ERM (exchange rate mechanism) and other industrial countries to determine whether the intro-

duction of EMS has been followed by improved economic convergence among countries participating in the ERM of the EMS. Finds that recent improvement in convergence in inflation rates and monetary policies has not been backed by corresponding progress in other developments, especially fiscal deficits. Appendices contain statistical information and legal texts concerning the EMS. Coauthors are: Owen Evans, Thomas Mayer, and Philip Young. The authors are in the European Department, International Monetary Fund, Washington, D.C. Selective bibliography; no index.

WACHTEL, HOWARD M. *The money mandarins: The making of a new supranational economic order*. New York: Pantheon Books, 1986. Pp. xvi, 254. \$18.95. ISBN 0-394-54299-1. JEL 87-0840

Discusses relationships between post-World War II political-economic changes in the United States and the emergence of a new supranational economy based on a "world of stateless money" run by private and public money mandarins. Considers supranationalism, the retreat from the liberal consensus, global economic interdependence, the conservative restoration, antecedents to the supranational economy, the end of Bretton Woods, and the information and communications revolution; proposes a public policy for a supranational order. Advocates the establishment of a new public debt authority for debtor nations with funds borrowed from the Eurodollar market, imposition of a cost on totalitarianism in international trade, discouragement of mergers and acquisitions that divert financial resources from productive capital investment projects, a transnational economic policy coordination of exchange and interest rates, and the reconstruction of a political economy that restores equilibrium between the private pursuit of personal gain in the market and the promotion of the common good through government. Wachtel is Professor of Economics, American University. Index.

WILLIAMSON, JOHN. *Political economy and international money: Selected essays of John Williamson*. Edited by CHRIS MILNER. New York: New York University Press; distributed by Columbia University Press, 1987. Pp. xii, 292. \$45.00. ISBN 0-8147-5434-1. JEL 87-0841

Thirteen papers and lectures, some published previously, present John Williamson's more recent work. Contains two papers in each of the following areas: economic theory and policy, exchange rates, liquidity and reserve needs, debt problems and development finance, international monetary reform, and domestic and global economic policy. Specific topics include: the post-1973 international

monetary system, the role of Keynes in the design of the postwar international economic order, the crawling peg in historical perspective, a survey of the literature on the optimal peg, reserve adequacy and international liquidity, effects of reserve growth on global inflation, resource transfer and the international monetary system, funding LDC debt, reassessment of world monetary reform, an agenda for monetary reform in the 1980s, macroeconomic management of the domestic economy, indexation, and the need to design a new global macroeconomic strategy and renew economic statesmanship. Williamson is at the Institute of International Economics, Washington, D.C. Index.

#### 440 INTERNATIONAL INVESTMENT AND FOREIGN AID

BAILEY, NORMAN A. AND COHEN, RICHARD. *The Mexican time bomb*. Twentieth Century Fund Paper series. New York: Priority Press, 1987. Pp. vi, 61. \$9.00, paper. ISBN 0-87078-209-6.

JEL 87-0842

Argues that the third world debt problem is not one of temporary illiquidity but one of structural overindebtedness. Uses the example of Mexico's problems as a case study of misdiagnosis by international monetary authorities. Examines: the origins of the Mexican debt crisis through the payments crisis of 1982; Mexico as a model of debtor responsibility; and the exacerbation of problems from 1983 to 1986, including the decreasing political capacity of the country to sustain adjustment, and the failure of the model. Proposes that the third world debt crisis has entered a new phase characterized by erosion of the leverage of the monetary authorities and growing incentives for default among debtors. Concludes that the only way Mexico can reduce its deficits and resume noninflationary growth is with debt relief. Recommendations include: liberalization and rationalization of the Mexican economy, increased development funding, debt service limitation, and securitization of at least the private portion of the debt. No index.

BORNER, SILVIO. *Internationalization of industry: An assessment in the light of a small open economy (Switzerland)*. New York; Berlin; London and Tokyo: Springer, 1986. Pp. xiii, 172. \$53.90. ISBN 0-387-16872-0.

JEL 87-0843

Studies the internationalization of the Swiss economy, noting that there "is no other highly developed country in the world which is so extremely and integrally exposed to the world-wide currents of financial and economic change as is Switzerland." Part 1 presents a historical and global perspective of interdependency through international-

ization. Part 2 describes new forms of international investment and export financing. Part 3 presents a general model of new forms of internationalization, emphasizing the transactions cost approach. The next part describes empirical research on the impact of new forms of internationalization on Swiss industry, based on case studies. The last part includes recommendations for economic policy and business strategy, such as supporting new business and innovation and revitalization of older firms and mature industries. Borner is with the Institut für Angewandte Wirtschaftsforschung, University of Basel. No index.

CHO, DONG-SUNG. *The general trading company: Concept and strategy*. Lexington, Mass. and Toronto: Heath, Lexington Books, 1987. Pp. xv, 159. \$25.00. ISBN 0-669-14296-4. JEL 87-0844

Discusses the development and growth of the general trading company (GTC) as an international business entity, distinct from the multinational corporation (MNC). Traces the history of the GTC over the past four centuries. Discusses the concept of the GTC, emphasizing diversification; how the GTC differs from the MNC, noting the differences in origin (manufacturing primarily for the MNC), growth, and strategies; and the transplantation of the GTC concept to other countries including Japan, Korea, Taiwan, Thailand, Turkey, and the United States. The final chapter reviews the generic strategies of the GTC, involving decisions regarding specialization, diversification, investment, foreign direct investment, and volume versus profits. Cho is an Associate Professor of International Business and Business Policy at Seoul National University. Glossary; bibliography; index.

CHR. MICHENSEN INSTITUTE, DEPARTMENT OF SOCIAL SCIENCE AND DEVELOPMENT, DEVELOPMENT RESEARCH AND ACTION PROGRAMME. *Zambia: Country study and Norwegian aid review*. Fantoft, Norway: Author, 1986. Pp. xxi, 202. Paper. ISBN 82-08584-06-7. JEL 87-0845

Reports on a study on the effectiveness of development aid to Zambia commissioned by the Norwegian Ministry of Development Cooperation. Part 1 details the political and economic environment in which development aid operates and discusses Zambia's institutional and social structure, its economic development during the period 1964-85, potentials and policies for agricultural development, and the state of basic needs and human rights. Part 2 deals with Norway's development cooperation with Zambia and covers the pattern of Norwegian development assistance, reviews major areas of bilateral assistance, outlines options for the future, and presents recommendations for

the structure, monitoring, and coordination of future development aid. Siegfried Pausewang, coordinator of this study, is associated with the Chr. Michelsen Institute, Bergen. Selected bibliography; no index.

DICKE, DETLEV CHR., ed. *Foreign debts in the present and a new international economic order*. Progress and Undercurrents in Public International Law series, vol. 1. Fribourg, Switzerland: University Press; distributed by Westview Press, Boulder, Colo., 1986. Pp. xii, 363. \$40.00, paper. ISBN 0-8133-0489-X. JEL 87-0846

Volume one of the series on Progress and Undercurrents in Public International Law. Contains the proceedings of the International Symposium on Foreign Debts in the Present and a New International Economic Order, held in Fribourg, Switzerland, in February 1986. Eighteen papers, one in French with an English summary, discuss the legal aspects of foreign debt in the context of a New International Economic Order. The papers examine alternative strategies; the evolution of indebtedness; developing country debt; the international monetary system and development; recent restructuring of international debt; IMF conditionality and state sovereignty; adjustment of loan agreements and strengthening international monetary soft law; the IMF's relationship with commercial banks; trade restrictions for balance of payments purposes and GATT; control of transborder movements of capital; Comecon as a debtor of the western financial system; the effects of economic coercion on heavily indebted countries; renegotiation and rescheduling; the Baker plan; foreign debt and international trade problems facing India; procedures and paradigms for renegotiation; and public debt, democratic principles, and the rule of law. The contributors are financial and legal specialists. Dicke is at the University of Fribourg, Switzerland. No index.

GIERSCH, HERBERT, ed. *The international debt problem: Lessons for the future*. Symposium series 1985. Tübingen, West Germany: Mohr, 1986. Pp. vi, 193. \$54.00. ISBN 3-16-345084-9. JEL 87-0847

Eight papers and comments from a symposium on the international debt problem, sponsored by the Kiel Institute of World Economics and the University of Kiel in June 1985. Papers address the topics of what went wrong and how the crisis could emerge and, more specifically, why the successful recycling of international capital in the 1970s led to overindebtedness; the debt problem and external shocks; bank lending and government intervention; government policies in developing

countries and future prospects; possible solutions to the transfer problem; the role of international organizations in the adjustment process; and government deposit insurance and moral hazard. Contributors are mainly economists. Giersch is Professor of Economics at the Kiel University. No index.

HEARN, PATRICK. *International business agreements: A practical guide to the negotiation and formulation of agency, distribution and intellectual property licensing agreements*. Aldershot, England and Brookfield, Vt.: Gower, 1987. Pp. viii, 222. \$59.50. ISBN 0-566-02597-3. JEL 87-0848

Designed as a practical guide for business negotiating or preparing an agreement with overseas associates. Deals with the five most common kinds of international agreements—appointing exclusive agents, appointing exclusive distributorships and licensing patents, know-how, and trade marks. Begins with a discussion of the general legal principles relating to all contracts, with special attention to the European Common Market. Contains a summary of the elementary rules of English contract laws and the application of these laws to international business transactions. Discusses items such as exclusive rights, obligations and responsibilities of agents and principals, commissions, warranties, confidentiality, duration, termination, conditions of sale, sales promotion, accounting records, protection of trade marks, infringements, settlement of disputes, royalties, and scope of agreements. Hearn is a barrister and consultant specializing in commercial agreements. Index.

KAZIS, DIMITRIS A. AND PERRAKIS, CHARALAMBOS I. *Licensing and Industrial Development: The case of Greece*. Translation. Centre of Planning and Economic Research Studies series, no. 4. Athens: Centre of Planning and Economic Research, [1984] 1986. Pp. 208. Paper. JEL 87-0849

Examines the licensing agreements currently existing between Greek and foreign firms and reviews the effects of such collaborations on the development of Greek industry. Explores in detail the terms of foreign technology transfer to Greece and their effects on Grecian industry, especially R&D, organization and management, and personnel training. Combines both a macro and micro approach: at the macro level, examines the extent of licensing agreements, their terms, and effects on economic indicators such as exports and imports. At the micro level, analyzes the positive and negative effects on enterprise. Analyzes data on royalty payments made by Greek firms since 1972, based on reviews of more than 100 licensing agreements, and interviews with about fifty Grecian companies. Concludes that licensing has had

a positive impact on the development of many Greek firms, at the cost of a greater dependence on foreign decision-making centers and the irrational development of certain industrial branches. Kazis is a research associate at the Centre of Planning and Economic Research. Perrakis is a manager in the Research and Economics Department, Commercial Bank of Greece. No index.

KHAN, KHUSHI M., ed. *Multinationals of the south: New actors in the international economy*. New York: St. Martin's Press, 1986. Pp. xi, 250. ISBN 0-312-55246-7. JEL 87-0850

Proceedings of an international conference organized by the German Overseas Institute in November 1985 at Hamburg. Twelve papers provide a theoretical and conceptual framework for an analysis of selected aspects of third world multinationals and their effects on the international economy. Essays examine their role as promoters of economic development, their activities in strategic sectors, and their significance for the South and discuss questions relating to the relevance of economic theory in explaining their emergence, their characteristics, and influence on strategies of self-reliance. Operational aspects of third world multinationals in production, trade, and finance are also discussed. Presents case studies of Arab and Indian multinationals, with empirical evidence. Concluding essays attempt to determine the areas in which old and new multinationals compete or cooperate, factors that govern their behavior patterns, and the practices and policies of the host countries of the South toward those multinationals. The contributors are mainly economists. Khan is Senior Research Fellow at the German Overseas Institute. Index.

OPPENHEIMER, MICHAEL F. AND TUTTIS, DONNA M. *Nontariff barriers: The effects on corporate strategy in high-technology sectors*. Boulder, Colo. and London: Westview Press, 1987. Pp. xiii, 203. \$25.00, paper. ISBN 0-8133-7403-0.

JEL 87-0851

Studies the impacts of Japanese and European nontariff barriers on the international marketing, investment, and technology strategies of small-to-medium-sized high-technology U.S. firms. Focuses on the interactions among market distortions, corporate strategy, and U.S. trade policy. Provides twenty-three case histories describing the experience of U.S. firms with Japanese and European import regimes. Discusses the principal nontariff barriers encountered by the firms and summarizes their effects on corporate strategies. Provides information on industry structure, foreign government targeting practices, general bilateral trade issues,

and case studies in the biotechnology, computer, semiconductor, software, and telecommunications equipment industries. Finds that the most effective means of circumventing market restrictions has been the establishment of a wholly owned subsidiary in the overseas market. Presents observations on the policy implications of the findings and makes recommendations regarding U.S. industry/government relations, data and analytical resources, legal issues, and diplomatic approaches. Oppenheimer is Executive Vice President, and Tutts is Senior Research Associate with The Futures Group. Bibliography; no index.

SARKOVIĆ, T. MISIHA. *Direct foreign investment in Yugoslavia. A microeconomic model*. New York and London: Greenwood Press, Praeger, 1986. Pp. xvii, 206. \$37.95. ISBN 0-275-92159-X.

JEL 87-0852

Develops a microeconomic model for joint ventures between multinational corporations and Yugoslav enterprises. Analyzes how the partners in a Yugoslav joint venture can reach an equilibrium solution to resource allocation and profit distribution on the basis of two different objective functions, maximization of profit or maximization of income per worker. Examines the performance of the Yugoslav self-management economy, the Yugoslav workers' self-management enterprise, theory of the multinational corporation, Yugoslav and socialist economy joint venture arguments, objectives and benefits of Yugoslav joint venture agreements, and legal regulations and the actual experience of Yugoslav joint ventures. Focuses on the role of transfer pricing, bargaining power, and structural inefficiencies that result from the unique structure of property rights in socialist Yugoslavia. The author is Assistant Professor of Economics, Jacksonville University. Bibliography; index.

UNITED NATIONS CENTRE ON TRANSNATIONAL CORPORATIONS. *Transnational corporations in South Africa and Namibia: United Nations public hearings*. Volume 1. *Reports of the Panel of Eminent Persons and of the Secretary-General*. U.N. Publication Sales No. E.86.II.A.6. New York: United Nations, 1986. Pp. xvi, 242. \$65.00, paper. ISBN 92-1-104179-1. JEL 87-0853

Volume 1 of the record resulting from U.N. public hearings held in September 1985 on the activities of transnational corporations in South Africa and Namibia. Major topics are: the activities and operations of transnational corporations in South Africa and the extent to which they contribute to and sustain the system of apartheid; the role of transnational corporations in the military and nuclear sectors of South Africa and Namibia; employ-

ment practices of transnational corporations and their socioeconomic impact, including effects on the housing patterns and lifestyles of families; and the activities and operations of transnational corporations in Namibia, particularly their exploitation of Namibian resources and their support of South Africa's illegal occupation. Part 1 consists of the panel report and recommendations. Part 2 presents a tabulation of activity measures proposed in U.N. resolutions and/or adopted in various countries. Part 3 contains a bibliography. First of a four-volume set. Also available in French, Russian, and Spanish. No index.

### 500 Administration; Business Finance; Marketing; Accounting

PAPPAS, JAMES L. AND HIRSCHHEY, MARK. *Managerial economics*. Fifth edition. Dryden Press Series in Economics. Chicago; Montreal; London and Sydney: Dryden, [1974 . . . 1983] 1987. Pp. xvi, 607. ISBN 0-03-008543-8. JEL 87-0854

Fifth edition of an economics textbook for managerial decision-making courses. [See JEL no. 83-0452 for annotation of the fourth edition.] Changes in the fifth edition include: more complete and user-oriented material on regression equations and statistics; a new chapter on forecasting, covering both qualitative and quantitative techniques; the development of optimal input combinations in the chapter on production; the expansion of cost analysis to provide more coverage of efficient scale, economies of scale, and experience; expanded material on market concentration; revision of treatment of government in the market economy to include questions of equity and efficiency and scope of deregulation; and a changed sequence of treatment of capital budgeting and uncertainty, including coverage of probability and game theory. Chapters contain summaries, questions, and extensively revised problems; short cases conclude each chapter. A mathematical appendix has been added to the second chapter. Pappas is at the University of South Florida. Hirschhey is at Rice University. Index.

### 510 ADMINISTRATION

ARKES, HAL R. AND HAMMOND, KENNETH R., eds. *Judgment and decision making: An interdisciplinary reader*. Cambridge; New York and Sydney: Cambridge University Press, 1986. Pp. xiv, 818.

\$59.50, cloth; \$21.95, paper. ISBN 0-521-32617-6. JEL 87-0855

General, interdisciplinary selection of forty-three readings chosen to assist the reader in developing an appreciation of the field of judgment and decision making. Requires an elementary understanding of algebra and statistics. Organized in eleven parts: introduction, judgment and social policy, economics, law, interpersonal conflict, clinical judgment in medicine and psychology, social prediction and judgment, experts, development and learning, research techniques, and overview. Many of the contributors are psychologists. Arkes is in the Department of Psychology, Ohio University. Hammond is in the Department of Psychology, University of Colorado. Name and subject indexes.

BERNIER, BERNARD AND SIMON, YVES. *Initiation à la macroéconomie: Manuel concret de 1er cycle (Initiation to macroeconomics)*. Second edition. Paris: Dunod; distributed in North America by Diffulivre, Montreal, 1986. Pp. xvi, 438. Fr 145.00; Can\$ 47.95, paper. ISBN 2-04-016517-7. JEL 87-0856

Introductory textbook covering all the major basic macroeconomic questions with special reference to business and managerial environments. Using real life examples and recent quantitative data, the authors have attempted, throughout the twenty-two chapters, to fulfill the needs of the students by providing a readable and practical manual on the subject. Bernier and Simon are professors, respectively, at the Centre H.E.C.-I.S.A. (Paris) and at the University of Paris-Dauphine. Bibliography, subject index. [Jean Mirucki]

FARRIS, MARTIN T. AND HAPPEL, STEPHEN K. *Modern managerial economics*. Glenview, Ill. and London: Scott, Foresman, 1987. Pp. 516. \$30.95. ISBN 0-673-18042-5. JEL 87-0857

Introductory textbook for courses in managerial economics, business economics, or theory of the firm; no prerequisites. Part 1 provides the foundations of managerial economics (the role of managerial economics; theory of the firm; profits; and the attempt to reduce uncertainty through forecasting). Part 2 examines revenue and costs (demand analysis; neoclassical production theory and short-run cost theory; and long-run costs, estimation, and alternative concepts). Part 3 considers market structures and government involvement (models of pure competition and pure monopoly; monopolistic competition; oligopoly; price discrimination and differentials; theories of profit; and the microeconomic role of government in the market place). Part 4 presents applications to real world pricing;

capital budgeting; nonprofit organizations; location of production and markets; and strategic decision making. Each chapter contains a summary and study questions. An IBM microcomputer simulation, instructor's manual, and student workbook are also available. The authors are at Arizona State University. Subject and name indexes.

HWANG, CHING-LAI AND LIN, MING-JENG. *Group decision making under multiple criteria: Methods and applications*. Lecture Notes in Economics and Mathematical Systems series, vol. 281. New York; Berlin; London and Tokyo: Springer, 1987. Pp. xi, 400. \$38.90, paper. ISBN 0-387-17177-0.

JEL 87-0858

Introductory textbook on the methods of group decision making under multiple criteria. Presents the methods of: social choice theory (various voting and counting systems, the social choice function, and the social welfare function); experts' judgment and/or group participation (including brainstorming, brainwriting, the nominal group technique, synectics, surveys, delphi method, conferences, cognitive map, implementing and controlling a project, the ordinal vs. cardinal approaches for evaluation/selection of alternatives, and a systems approach to experts' judgments and/or group participation analysis); and game theory. Sequel to the authors' works pertaining to multiple objective and multiple attribute decision making [See JEL nos. 79-0698 and 82-0785 for annotations of the previous works]. Hwang is in the Department of Industrial Engineering, Kansas State University. Lin is in the Department of Physics and Engineering, Roosevelt University. No index.

KEATING, BARRY AND WILSON, J. HOLTON. *Fundamentals of managerial economics*. San Diego; London; Sydney and Toronto: Harcourt, Brace, Jovanovich; Academic Press, 1987. Pp. xii, 625. \$32.95. ISBN 0-15-529457-1.

JEL 87-0859

Intended for use in applied economics courses that deal with the economics of the firm. Emphasizes applications of microeconomic theory; also uses tools from statistics, mathematics, operations research, and macroeconomics. Demonstrates how economic concepts such as elasticity, forecasting, demand analysis, production, and cost are used by business decision makers. Includes a discussion of the role of business economists. Reviews basic graphic and statistical tools. Covers demand, including demand forecasting, using both qualitative and quantitative techniques; production and cost theory; the use of linear programming as an optimizing tool, emphasizing when to raise it and how to interpret the results; different market structures and pricing decisions; the regulation of business;

and risk and capital budgeting. Chapters contain summaries, reading lists, and problems. Keating is at the University of Notre Dame and Wilson is at Central Michigan University. Index.

LAMB, ROBERT BOYDEN. *Running American business: Top CEOs rethink their major decisions*. New York: Basic Books, 1987. Pp. x, 315. \$19.95. ISBN 0-465-07150-3.

JEL 87-0860

Presents the results of interviews with eighty-nine CEOs, focusing on how strategies are determined, the influence of manager personalities, the extent of planning, the influence of external forces, and the degree of internal control over options. Points out that the CEO must balance conflicting interests of institutional investors, lenders, customers, financial markets, and government. Describes the environment in which the CEO operates as the "phantom club" of CEOs—"a free-floating, shifting collection of informal and formal relationships that CEOs build throughout their careers." Probes areas of strategic decisions such as finance, marketing, technology, takeovers, manpower, and succession. Concludes by emphasizing the environment of uncertainty in which the CEO must operate today. Uses specific examples of CEOs and companies to illustrate points. Lamb is Clinical Professor of Finance and Management at New York University. Indexes of executives and corporations.

LEVI, ISAAC. *Hard choices: Decision making under unresolved conflict*. Cambridge; New York and Melbourne: Cambridge University Press, 1986. Pp. xii, 250. \$34.50. ISBN 0-521-32527-7.

JEL 87-0861

Develops a framework to analyze rational decision making under unresolved conflict in values. Proposes that conflict in values is often generated by uncertainty concerning the consequences of the feasible options and that inquiry does not always lead to resolution of conflicts in value by the time a choice is required. Examines moral conflict; value conflict in scientific inquiry; value pluralism; questions regarding choice, foreknowledge and feasibility; value commitments, structures, ways of evaluation, and criteria of admissibility; uncertainty as a source of conflict; the relation between the rationality of decision making under unresolved conflict and social agency; and distributing benefits. Critiques various versions of utilitarianism, Rawlsian approaches to distribution, and Arrowian approaches to social choice. Concludes that this revision of the assumptions that underlie most decision theory, microeconomic theorizing, and risk assessment offers a vision of problem-solving inquiry applicable to both scientific inquiry and efforts to

settle unresolved conflicts. Levi is Professor of Philosophy, Columbia University. Bibliography; name and subject indexes.

JOY, ROBERT H. *Operations technology: Systems and evolution*. Baltimore and London: Johns Hopkins University Press, 1986. Pp. xv, 252. \$32.50. ISBN 0-8018-3340-X. JEL 87-0862

Portrays the development of operations technology in an evolutionary sequence. Identifies, defines, and exemplifies seven operations technologies according to the manner in which related operations that provide goods or services to customers and clients are arranged and performed: jobbing system control and articulated, balanced, continuous, automated, programmed, and "intelligent" systems. Compares the seven system technologies by examining the time and other dimensions of five elemental intervals (moving unit or batch of product or service to a work center, processing job at work center, stoppages, delays to work in process, and sequencing delays). The comparative dimensions used are: total time, cycle time, operational efficiency, system efficiency, working-capital requirements, work-in-process inventory, operational floor-space requirements for events taking place between points of entry into a system, and completion of the product or service the system provides. Examples of work situations in the system technologies examined include: purchasing, public works procurement, an outpatient clinic, legal and judicial processes, nuclear power, a rail mill, a flour mill, bookmaking, telephone cable, a research library, a money market fund, robots, and expert programming in medical diagnosis. Roy is Dean Emeritus of Engineering and Professor Emeritus of Industrial Engineering, Johns Hopkins University. Index.

SLOVIN, MYRON B. AND SUSHKA, MARIE E. *Macroeconomics for managers*. Englewood Cliffs, N.J.: Prentice-Hall, 1987. Pp. xvi, 512. ISBN 0-13-42837-4. JEL 87-0863

Textbook designed for a course in business macroeconomics. Assumes no prior economics background and little mathematical facility. Has an applied orientation, focusing on how changes in the economy or in economic policy influence the firm. Reviews the tools of economics, presents a model of aggregate demand and supply, and discusses the financial sector and financial decision making, investment, and public policy issues, particularly as they affect the business sector and managerial decisions. Divided into five parts: foundations of macroeconomics, the macroeconomic model, the financial sector, the determinants of spending, and economic policy. Includes summary, references,

and exercises at end of chapters. Slovin is Professor of Finance at the University of Colorado, Denver. Sushka is Professor of Finance at Arizona State University. Index.

VON WINTERFELDT, DETLOF AND EDWARDS, WARD. *Decision analysis and behavioral research*. Cambridge; New York and Melbourne: Cambridge University Press, 1986. Pp. xv, 604. ISBN 0-521-27306-X. JEL 87-0864

Textbook for first-year graduate students with no mathematical prerequisites, though also intended for use by mature decision scientists. Emphasizes the intertwining of formal analysis and behavioral research and gives primary attention to governmental rather than business examples. Covers: basic concepts and their relation to behavior, structuring for decision analysis, decision trees, uncertainty and its measurement, Bayesian statistics, inference, value and utility measurement, multiattribute utility theory, sensitivity analysis and flat maxima, applications and pitfalls of analysis, cognitive illusions, and history and research prospects of decision analysis. Von Winterfeldt is at the Institute of Safety and Systems Management and Social Science Research Institute and Edwards is at the Social Science Research Institute, University of Southern California. Author and subject indexes.

## 530 MARKETING

BACKHAUS, KLAUS AND WILSON, DAVID T., eds. *Industrial marketing: A German-American perspective*. Berlin; New York and Tokyo: Springer, 1986. Pp. viii, 373. \$39.00. ISBN 0-387-16114-7. JEL 87-0865

Seventeen papers presented at the German-American conference on Industrial Marketing, held in Mainz, West Germany, in September 1984. Focus is on industrial marketing research in both countries, with the aim of promoting increased co-operative research in this field. Essays are in eight sections: state of the art in West Germany and the United States (2 papers); industrial buying behavior (2 papers); industrial selling behavior (2 papers); interaction behavior (3 papers); marketing/technology mix (3 papers); risk assessment and risk behavior (2 papers); methodological concepts (2 papers); and new industrial product success (2 papers). Most of the contributors are marketing and

management specialists. Backhaus is Professor of Business Administration and Marketing at the Johannes Gutenberg University, Mainz. Wilson is Professor of Marketing at the Pennsylvania State University. No index.

**McAULIFFE, ROBERT E.** *Advertising, competition, and public policy: Theories and new evidence.* Lexington, Mass. and Toronto: Heath, Lexington Books, 1987. Pp. vi, 116. ISBN 0-669-12391-9.

JEL 87-0866

Provides a survey of the theoretical issues in the debate over the effect of advertising expenditures, incorporating new developments such as strategic deterrence, consistent conjecture, barriers to entry, and information theories. Describes the controversy over the causal relation between advertising and measures of market power. Reviews models that show that the positive correlation between advertising and profits may be due to other factors. Analyzes the difficulties faced in measuring the advertising/profit relationship. Reviews the results of several causal tests for twenty-seven firms for the period 1955-83. Concludes with a discussion of advertising and public policy, including the effects of advertising restrictions on welfare. McAuliffe is Assistant Professor of Economics at Babson College in Wellesley, Massachusetts. Index.

#### 540 ACCOUNTING

**JENKINS, ALEXANDER W.** *The accounting profession in Alberta: An economic analysis of licensure and self-regulatory reforms, and a counter-proposal.* Vancouver, British Columbia: Fraser Institute, 1986. Pp. xiv, 77. \$7.95, paper. ISBN 0-88975-090-4.

JEL 87-0867

Analyzes the need for both self-regulatory and exclusive practice reforms in Alberta accountancy. Examines the nature of accounting, public accounting, and the accounting profession as well as the professionalism and self-regulatory status of chartered, certified general, certified management, and other accountants in Alberta. Evaluates industry performance, the scope for reform, and the social costs and benefits of the current exclusive practice/licensure issue, i.e., limiting provincial audits to members of the Institute of Chartered Accountants of Alberta. Concludes that there is a need for self-regulatory legislative reforms, which are more uniform, comprehensive, and compelling than the current legislative bills, and that if exclusive practice rights for audits and reviews are granted, audit licensure should be broadened to include all accountants that could be designated as audit specialists. Jenkins is Associate Professor of Economics, University of Alberta. No index.

### 600 Industrial Organization; Technological Change; Industry Studies

#### 610 INDUSTRIAL ORGANIZATION AND PUBLIC POLICY

**ADLER, HANS A.** *Economic appraisal of transport projects: A manual with case studies.* Second edition. World Bank Economic Development Institute Series in Economic Development. Baltimore and London: Johns Hopkins University Press for the World Bank, [1969] 1987. Pp. xii, 235. \$27.50, cloth; \$12.50, paper. ISBN 0-8018-3429-5, pbk.

JEL 87-0868

Introductory textbook on the economics of transport projects in developing countries. Revisions include incorporation of literature appearing since the first edition, advances in methodology such as shadow pricing, and additional empirical information. Places greater emphasis on transport sector planning as a prerequisite for appraising individual projects, on rural roadways, and on applications of cost-benefit analysis to investigate, operations, and maintenance. Part 1 provides a background on the methodology of economic appraisal, describing economic costs, shadow prices, traffic forecasting, optimum timing, risk analysis, and use of cost/benefit appraisals. Part 2 illustrates the practical application of economic analysis, presenting fifteen case studies of various projects that cover the principal modes of transport—roads, railways, pipelines, ports, and airports. Adler is Senior Adviser in the Projects Policy Department of the World Bank. Bibliography; index.

**CREW, MICHAEL A. AND KLEINDORFER, PAUL R.** *The economics of public utility regulation.* MIT Press Series on the Regulation of Economic Activity. Cambridge, Mass.: MIT Press, 1986. Pp. viii, 304. ISBN 0-262-03127-2.

JEL 87-0869

An analysis of important issues of theory and policy formulation related to public utility regulation. Part 1 examines the welfare economic foundations of public utility regulation. Part 2 surveys the theory of peak-load pricing. Part 3 reviews the principles and practice of regulation in the United States. Part 4 discusses the nature of regulation in the electricity, telecommunications, gas, and water supply industries, and outlines certain implications for future research and policy. Crew is Professor of Economics at Rutgers University. Kleindorfer is Professor of Decision Sciences and Economics at the University of Pennsylvania. Index.

**ECONOMIC COUNCIL OF CANADA.** *Minding the public's business.* Ottawa: Author; distributed by Supply and Services Canada, Ottawa, 1986. Pp. xii, 180.

\$10.95, Canada; \$13.15, other countries; paper. ISBN 0-660-12317-0. JEL 87-0870

Study of government enterprise in Canada for the purpose of determining under what circumstances government enterprise is an appropriate policy response as well as its optimal administrative arrangements. Examines the extent of government ownership and reviews the factors underlying the emergence of the government enterprise sector and activities of public corporations in specific sectors (electric power, telecommunications, urban transit, transportation, and nonrenewable resources) and their use as instruments of industrial policy (government as entrepreneur, bailouts, and mixed enterprises). Identifies components of an accountability and control framework for government enterprise. The conclusion discusses the advantages and issues related to government enterprise and/or privatization. Recommends greater accountability and control of existing government enterprises, greater involvement of the private sector and promotion of competition, and privatization of Air Canada and Petro-Canada. No index.

GREER, DOUGLAS F. *Business, government, and society*. Second edition. New York: Macmillan, London: Collier Macmillan, 1987. Pp. xvii, 574. \$26.50. ISBN 0-02-347120-4. JEL 87-0871

Second edition of an introductory textbook for undergraduate business and government courses. Changes have been made to reflect new government and research findings and major recent policy and economic developments, particularly those related to telecommunications, merger enforcement and acquisition trends, misrepresentation and unfair practices, resale price maintenance and vertical restraints, hazardous waste regulations, nuclear power plant failures, and transportation deregulation. Each chapter contains summaries and exercises. [For annotation of first edition, see JEL no. 84-0508.] Greer is at San Jose University. Glossary; name, case, and subject indexes.

COBSON, STAFFAN. *Electronics and industrial policy: The case of computer controlled lathes*. World Industry Studies series, no. 5. London; Boston and Sydney: Allen and Unwin, 1986. Pp. xx, 252. \$37.95. ISBN 0-04-338138-3. JEL 87-0872

Deals with microelectronics-based innovations in machine tools, focusing on the production and use of computer numerically controlled machine tools in the world economy, particularly in the third world. Uses Argentina, Taiwan, South Korea, Japan, and a few European countries for case materials. Interested especially in the implications that computer numerically controlled machine tools may have for the newly industrializing nations, ap-

proaching the problem as one of applied economics. Examines the place of the developing countries in the international division of labor, how readily producers of conventional lathes can switch to computer numerically controlled lathes, and the role of government in this process. Concludes that government intervention policies need to be product specific rather than uniform between firms. Based on author's Ph.D. thesis in economics at the University of Sussex (1985). Jacobsson is a Research Fellow at the Research Policy Institute at the University of Lund, Sweden. Index.

JACQUEMIN, ALEXIS. *The new industrial organization: Market forces and strategic behavior*. Translated by FATEMEH MEHTA. Cambridge, Mass. and London: MIT Press, [1985] 1987. Pp. x, 217. \$27.50, cloth; \$12.50, paper. ISBN 0-262-60014-5, pbk. JEL 87-0873

Originally published in French as *Sélection et pouvoir dans la nouvelle économie industrielle* in 1985. Surveys approaches of the "new industrial organization" that are applied to the enterprise, its market relations, and its internal organization. Contrasts the perspective that the industrial economy adapts itself to the norms of an efficient allocation of resources with the perspective that stresses the role of market power. Points out that the roles attributed to economic policy and industrial policy will be different according to the weight given to these two paradigms. Covers selective market mechanisms, the behavior of corporations trying to exploit oligopolistic interdependencies; the role of potential competition; organizational forms adopted by enterprises; and different roles assigned to industrial policy. Jacquemin directs the Centre for Economic and Legal Research in Industrial Organization at the Catholic University of Louvain in Louvain-la-Neuve, Belgium. Index.

KHAZZOUM, J. DANIEL. *An econometric model integrating conservation measures in the residential demand for electricity*. Contemporary Studies in Energy Analysis and Policy series, vol. 8. Greenwich, Conn. and London: JAI Press, 1986. Pp. xx, 305. ISBN 0-89232-686-4. JEL 87-0874

Develops a model designed to integrate engineering and economic approaches to modeling the household demand for electricity in a service area and separate out the contribution of the engineering effect of efficiency improvement from the feedback effect and the effects of economic variables. Estimates the model for electrically heated and gas-heated homes from 1969-80, and incorporates differences between summer and winter demand; focuses on the Sacramento Municipal Utility District. Discusses: the problem of quantifying the

impact of conservation; the specification of the model, especially the development of indices of appliance efficiency and of thermal integrity and their integration with economic variables that affect electricity demand; and the estimation and testing of the model. Khazzoom is a member of the Department of Economics, University of California, Berkeley. Index.

MORVAN, YVES. *Fondements d'économie industrielle (Foundations of industrial economics)*. Gestion. Paris: Economica; distributed in North America by Diffuseur G. Vermette, Boucherville, Quebec, 1985. Pp. iv, 482. Fr 150.00; Can\$ 41.95, paper. ISBN 2-7178-0930-9. JEL 87-0875

Provides a variety of thematic articles useful to the general practitioner. Each one of them is treated with graphs, practical examples and with reference to the pertinent literature. Includes annotated description of statistical sources on industrial activity. Morvan is a professor at the University of Rennes and responsible for the Groupe d'Etudes des Systèmes Industriels. Bibliography; subject index. [Jean Mirucki]

NORMAN, G., ed. *Spatial pricing and differentiated markets*. London Papers in Regional Science series, no. 16. London: Pion; distributed in the U.S. by Methuen, N.Y., 1986. Pp. 190. \$24.95, paper. ISBN 0-85086-121-7. JEL 87-0876

Thirteen papers resulting from a session on spatial pricing and spatial equilibrium at the Annual Conference of the British Section of the Regional Science Association in Manchester in September 1985. Considers areas of interest to regional science and spatial economics. Specific topics are: "address" models of differentiation, equilibrium existence in the circle model of product differentiation, existence of price equilibria under mill and uniform delivered price policies, stability of cartels in spatial markets, competitive mill and uniform pricing, demand curves and spatial pricing, spatial competition with cross-hauling, costs and social welfare in the theory of the spatial firm and industry, market strategy with variable entry threats, the economics of vertical restraints on retailers, intra-urban retail price competition, and regional price discrimination in the U.K. gas industry. Norman is a member of the Department of Economics, University of Leicester. Author and subject indexes.

PATRICK, HUGH, ed. *Japan's high technology industries: Lessons and limitations of industrial policy*. With the assistance of LARRY MEUSNER. Seattle and London: University of Washington Press; Tokyo: University of Tokyo Press, 1986. Pp. xxi, 277. \$40.00. ISBN 0-295-96342-5. JEL 87-0877

Seven essays, the result of a project sponsored by the Committee on Japanese Studies, focus on high technology industries, industrial policy, and the Japanese economy. Essays present an analysis and evaluation of Japanese high technology and assess its relevance for the United States. Several essays present case studies of the information industry, biotechnology, and the full range of high tech industries. Others examine the characteristics of the way the Japanese government, through the Ministry of Trade and Industry (MITI), formulates and administers high tech industrial policy, describing the array of industrial policy implements. Also discusses a joint United States-Japanese research project involving cooperation of competitive firms. The final essay traces the evolution of Japanese industrial policy since the 1950s, proposing general lessons for the U.S. from the Japanese experience. Contributors are social scientists, and international and business specialists. Patrick is R.D. Calkins Professor of International Business at Columbia University. Index.

PUTTERMAN, LOUIS, ed. *The economic nature of the firm: A reader*. With the assistance of RANDY KROSZNER. Cambridge; New York and Melbourne: Cambridge University Press, 1986. Pp. x, 371. ISBN 0-521-32278-2. JEL 87-0878

Twenty-four papers (all previously published) discuss topics regarding the economic nature of the firm. Part 1 deals with the division of labor within and among firms, containing selections by Adam Smith, Karl Marx, Frank Knight, and Alfred Chandler as well as papers on the nature of the firm, the use of knowledge, and relational exchanges. Part 2 deals with the employment relation, the internal organization of the firm, individual mobility and union voice, and productivity. Part 3 contains papers on the management, finance, and scope of the firm. Part 4 presents radical perspectives on firm structure and includes papers on the role of hierarchy, an institutional approach to the organization of work, why capital hires labor, and alternative models of the production process in a competitive economy. The contributors are mainly economists. Putterman is at Brown University. No index.

RICKETTS, MARTIN. *The new industrial economics: An introduction to modern theories of the firm*. New York: St. Martin's Press, 1987. Pp. xii, 306. \$29.95. ISBN 0-312-00458-3. JEL 87-0879

Reviews theoretical developments in the theory of the firm, emphasizing the problem of information and transactional difficulties encountered in a world in which people are not fully informed.

Especially concerned with explaining how transactions costs theory affects views of business enterprise. Author's theory of the firm is based on exchange and uses the Edgeworth box for analysis. Part 1 describes the basic concepts and includes chapters on the gains from trade, transactions costs, the entrepreneur, and property rights. Part 2 discusses the nature of the internal structure of the firm, viewing it as a governance structure for complex and implicit exchange transactions. Considers the contractual problem faced by principal and agent in analytical detail, the organization of hierarchies within firms, determinants of the size and scope of firms, and the division of ownership from control. Concludes that firms continually adjust to new circumstances and require entrepreneurs to assist in the process by using the knowledge of workers, making judgmental decisions about the appropriate responses to economic change, pushing through new developments, and restructuring property rights as new information becomes available. Ricketts is a Reader in Economics at the University of Buckingham. Bibliography; name and subject indexes.

U.S. DEPARTMENT OF COMMERCE. *A competitive assessment of the U.S. pharmaceutical industry*. International Competitive Assessment Series. Boulder and London: Westview, 1986. Pp. xii, 113. \$28.50, paper. ISBN 0-8133-7277-1.

JEL 87-0880

Focusing, on the development of new drugs, identifies underlying forces that will influence international competition of the pharmaceutical industry in the future, such as an aging population increasing the demand for the industry's products, advances in biotechnology, rising R&D costs, increasing pressure for health care containment programs, and increasing ethical involvement as new drugs affecting life become available. Describes the evolution of the industry; the performance of the industry, covering sales, growth, productivity, R&D and profitability; the international competitive scene; research and development expenditures in selected countries; the effect of government regulation on international competition; the drug development process; trends for the future; strategies of foreign governments, particularly the United Kingdom, Japan, and West Germany; and the projected international future for the industry including policy options. Suggests that federal policy might include improved FDA guidelines, investment in computer analysis related to drug design and testing, and FDA assistance in management information systems. Also calls for increased industry R&D outlays, particularly cooperative projects. Glossary; bibliography; no index.

WENDERS, JOHN T. *The economics of telecommunications: Theory and policy*. Cambridge, Mass.: Harper and Row, Ballinger, 1987. Pp. x, 284. \$34.95. ISBN 0-88730-119-3. JEL 87-0881

Demonstrates how economic tools can be applied to explain current behavior in the telecommunications industry and to help develop future public policy consistent with economic efficiency. Gives the background in economics necessary to understand the policy prescriptions stemming from economic efficiency. Reviews welfare economics and its relationship to competitive markets. Develops a simple model of the various telecommunications markets by assuming regulation and then examining what policy to follow. Examines factors such as demand, usage, optimal pricing, local measured service, benefit/cost, and extended area service. Argues that the telecommunications cartel was established and fostered by the political process and that regulators have been exposed to pseudoeconomic rationalizations to justify telephone pricing policies. Concludes that although it may be politically optimal to continue to subsidize local service from toll markets, it is economically less efficient than complete deregulation. Wenders is Professor of Economics at the University of Idaho. Index.

See also: Book Numbers JEL 87-0669, 87-0670, 87-0785, 87-0848, 87-0857, 87-0873, 87-0909

## 630 ECONOMICS OF TECHNOLOGICAL CHANGE

HIERONYMI, OTTO, ed. *Technology and international relations*. With contributions by MICHEL BARJON ET AL. New York: St. Martin's Press, 1987. Pp. 194. \$32.50. ISBN 0-312-78933-5.

JEL 87-0882

Twelve papers examine the role of technology in international relations. Papers discuss the international aspects of technology in terms of medicine, war, and economics; the role of government subsidies to industrial innovation; the nature and causes of long waves; the changing role of agriculture in international trade and aid; technology and economic growth; technology and economic leadership; alternative R&D strategies; changing social values and lifestyles and their implications for technology; the industrial development of OAEPEC countries; technology and the terms of trade; transfer of technology and the third world; and integrating science and technology with economic strategies. The contributors are mainly economists and scientists. Hieronymi is head of the Program of Economic Analysis and Forecasting, Battelle-Geneva Research Centres, Geneva Switzerland. No index.

KATZ, JORGE M., ed. *Technology generation in Latin American manufacturing industries*. New York: St. Martin's Press, 1987. Pp. xi, 549. \$39.95. ISBN 0-312-79002-3. JEL 87-0883

Sixteen papers many of which were submitted at the seminar on technology and economic development of the Research Programme on Scientific and Technological Development in Latin America in Buenos Aires at the end of 1978. The Program is supported by the Inter-American Development Bank, the Economic Commission for Latin America, the United Nations Development Program, and the Canadian International Development Research Center. Much of the research was conducted by a team of economists and engineers and pertains to Argentina, Brazil, Mexico, Venezuela, Colombia, and Peru. Papers explore problems of technological change in manufacturing industries. Part 1 consists of four papers on the state of the theory of innovation. Part 2 presents abridged versions of ten case studies. Five are studies of individual firms, i.e., integrated steel producers in Argentina, Brazil, and Mexico; a rayon producer in Argentina; and two petrochemical plants. Three are industry studies (cigarettes, construction, and cement in Argentina) and two are macroeconomic studies pertaining to the nature and determinants of technical change in the Peruvian industrial sector and the Argentine experience in the international sale of industrial plants and engineering work. The remaining two papers present preliminary theoretical efforts toward constructing a theory of innovation. The contributors are mainly economists and science, technology, and policy specialists. Katz is Professor of Industrial Economics at the University of Buenos Aires and Senior Research Fellow at the Economic Commission for Latin America in Buenos Aires. Index.

NIJKAMP, PETER, ed. *Technological change, employment and spatial dynamics: Proceedings of an international symposium on technological change and employment: Urban and regional dimensions, held at Zandvoort, the Netherlands, April 1-3, 1985*. Berlin; New York and Tokyo: Springer, 1986. Pp. vii, 466. \$38.50, paper. ISBN 0-387-16478-2. JEL 87-0884

Proceedings of an international symposium on Technological Change and Employment: Urban and Regional Dimensions. Twenty-four papers focus on two themes: the relationship between technological developments and shifts in the labor market and the interaction between the urban or regional production environment and technology changes. Papers in part 1 discuss general, theoretical, and methodological aspects of aforementioned relationships. Those in part 2 examine actual trends

in the spatial dimensions of technological developments and employment. Part 3 focuses on the modeling efforts directed toward analyses of: adaptive economizing, technological change, and the demand for labor; spatial allocation of capital and labor; residential and labor mobility; spatial evolution, spatial mobility, employment, and technology; innovation and urban life cycles; the dynamics of regional specialization over time in individual establishments; and regional growth. The contributors are economists, geographers, and urban and regional specialists. Nijkamp is at the Free University, Amsterdam. No index.

STEWART, FRANCES, ed. *Macro-policies for appropriate technology in developing countries*. Boulder, Colo. and London: Westview Press in cooperation with Appropriate Technology International, Washington, D.C., 1987. Pp. x, 315. \$29.85, paper. ISBN 0-8133-7303-4. JEL 87-0885

Nine papers, which were the focal point of a workshop held in Washington, D.C., in January 1986 sponsored by Appropriate Technology International and the Overseas Development Council. The collection based on the hypothesis that the failure in achieving appropriate technology on a significant scale in developing countries may be attributed to obstacles resulting from macro-policies. The introductory paper by the editor provides a classification of macro-policies for appropriate technology. Seven papers review empirical studies of policies designed to promote appropriate technology. Studies examine technology choice in agriculture in India (Ashok Rudra), irrigation in Bangladesh (Stephen Biggs and Jon Griffith), small farm paddy threshing technology in Thailand and the Philippines (Bart Duff), rural linkages in the Philippines and Taiwan (Gustav Ranis and Frances Stewart), appropriate technology in sugar manufacturing (Raphael Kaplinsky), manufacturing in Kenya and Tanzania (Jeffrey James), and technological change and appropriate technology in Latin America (Philip Maxwell). A final paper written by the editor provides an overview and concludes that the major problem in securing desired policy changes lies in the political economy. Stewart is Fellow of Somerville College and Senior Research Officer at Queen Elizabeth House, Oxford University. Index.

### 630 INDUSTRY STUDIES

GOLOMBEK, ROLF; HOEL, MICHAEL AND VISLIE, JON, eds. *Natural gas markets and contracts*. Contribu-

tions to Economic Analysis series, no. 161. Amsterdam; New York; Oxford and Tokyo: Elsevier Science, North-Holland; distributed in North America by Elsevier Science, New York, 1987. Pp. x, 320. \$66.75. ISBN 0-444-70206-7.

JEL 87-0886

Fourteen contributions divided into three parts. The first part contains three papers that analyze the economic and political features of the European natural gas market. Argues that the position of suppliers was weakened after 1974, especially because Norway, Algeria, and the U.S.S.R. exported too much gas. Considers a partial equilibrium model and analyzes the extent of market power by producers. Discusses the privatization of British gas and possible consequences. Part two describes different aspects of the demand for natural gas. The three papers discuss the dynamics of interfuel substitution in the OECD-European industrial sector; the residential demand for natural gas, using a discrete-continuous dynamic choice model; and the diversification of natural gas imports. Part 3 deals with negotiation problems, bargaining theory, and the design of long-term contracts. Examines the Norwegian experience, the relationship between the price of natural gas and crude oil, bilateral monopoly and exhaustible resources, and evidence on natural gas contracting in the United States. Colombek, Hoel, and Vislie are members of the Department of Economics, University of Oslo. Subject and author indexes.

JAMES, ESTELLE AND ROSE-ACKERMAN, SUSAN. *The nonprofit enterprise in market economics*. Fundamentals of Pure and Applied Economics series, no. 9, Economics Systems section. Chur, Switzerland; London; Paris and New York: Harwood Academic, 1986. Pp. viii, 102. Paper. ISBN 3-7186-0329-2.

JEL 87-0887

An analysis of private nonprofit organizations which have no owners with a legal right to appropriate the surplus generated by the organization. Primarily concerned with philanthropies, which derive a portion of their revenues from tax deductible contributions. Presents observations on the scope of the nonprofit sector and examines theories of nonprofit organization formation. Provides models of nonprofit's behavior and a comparison of nonprofit and profit-making organizations. Discusses the ideology, resources and competition of the nonprofits. Also contrasts nonprofits with profit-constrained firms and bureaucracies. Concludes with a discussion of policy issues. James is a Professor of Economics and Chair of the Economics Department at the State University of New York at Stony Brook. Rose-Ackerman is Professor of Law and Political Economy and Director of the Center for Law

and Economic Studies at Columbia University. Bibliography; index.

NATIONAL RESEARCH COUNCIL, COMMISSION ON ENGINEERING AND TECHNICAL SYSTEMS, MANUFACTURING STUDIES BOARD. *Toward a new era in U.S. manufacturing: The need for a national vision*. Washington, D.C.: National Academy Press, 1986. Pp. xiv, 174. \$12.50, paper. ISBN 0-309-03601-7.

JEL 87-0888

Presents a broad view of what the Manufacturing Studies Board of the National Research Council believes will be necessary to maintain a competitive U.S. manufacturing sector along with some of the major considerations manufacturers and government policy makers will face in the implementation of policies. Recognizes diversity in manufacturing, including technological needs, management and labor relations, and relative competitive positions. Examines the role of technology, changes in the management of people and organization design, and considerations for government in future manufacturing policies. Notes three powerful trends that are causing a revolution in manufacturing: worldwide manufacturing capabilities, advances in technology, and changes in traditional management-labor practices, organizational structures, and decision-making procedures. Concludes that many of the advanced technological systems can be implemented currently and must be implemented soon for competitiveness to result. Appendices contain a description of the technology of future manufacturing and policy recommendations of panels and commissions, 1979-85. Bibliography; index.

REES, JUDITH AND ODELL, PETER, eds. *The international oil industry: An interdisciplinary perspective*. New York: St. Martin's Press, 1987. Pp. xii, 181. \$35.00. ISBN 0-312-00242-4.

JEL 87-0889

Nine papers on the factors influencing the international oil market and its interrelationships with other elements in the world political economy. Contributors include academic commentators and experts from oil companies and governments, who bring together views of economics, law, political science, international relations, and geography. Outgrowth of a seminar series on oil conducted at the London School of Economics. Essays discuss international oil issues and perspectives, the structure of the oil industry, the international community, the economics of the international oil industry, the international legal structure of petroleum exploitation, status and strategies of the international oil corporations, European oil and gas issues, oil funding and international financial markets, and

a third world perspective on petroleum. Conclusion consists of short comments on the issues raised representing the varying disciplinary perspectives. Rees is Senior Lecturer in Geography at the London School of Economics and Political Science. Odell is Director of the Centre for International Energy Studies at Erasmus University, Rotterdam, and a Visiting Professor at the London School of Economics. Index.

U.S. PRESIDENT. *The state of small business: A report of the President: transmitted to the Congress May 1986; together with the annual report on small business and competition of the U.S. Small Business Administration*. Washington, D.C.: U.S.G.P.O., 1986. Pp. xxiv, 316. Paper.

JEL 87-0890

Fifth annual report by the President to Congress on the state of small business. Report is divided into four chapters as follows: (1) the State of Small Business, discussing formations, closings, earnings, job growth, composition of the sector, and changes; (2) Small Business Financing, emphasizing sources and uses of funds, financing patterns, equity financing of larger small businesses and new venture-type enterprises, and recent financing developments; (3) Veterans in Business, examining federal assistance, demographic characteristics of veterans, characteristics of veteran-owned businesses and their owners, veteran's participation in self-employment, and financial success; and (4) Self-employment as a Business, focusing on growth, characteristics, gender, and income. Appendices deal with female and minority owned businesses, changing characteristics of workers and business size, procurement, and dimensions of small business. Glossary; index.

VELLAS, FRANÇOIS. *Economie et politique du tourisme international (Economics and policy of international tourism)*. Paris: Economica; distributed in North America by Diffuseur G. Vermette, Boucherville, Quebec, 1985. Pp. 306. Fr.125.00; Can\$ \$34.95, paper. ISBN 2-7178-1011-0.

JEL 87-0891

Applies standard instruments of economic analysis to the study of international tourism, particularly cost/benefit of tourism policies with respect to balance of payments, job creation, capital movements and investments. Macroeconomic policies are evaluated in terms of tourism planning and social tourism objectives in industrial and third world countries. The author presents numerous tables and graphs, using recent international data. Vellas is a professor at the University of Toulouse. Bibliography; subject index. [Jean Miracki]

## 700 Agriculture; Natural Resources

### 710 AGRICULTURE

BALE, MALCOLM D., ed. *Horticultural trade of the expanded European community: Implications for Mediterranean countries*. World Bank Country Study series. Washington, D.C.: World Bank, 1986. Pp. x, 274. \$15.00, paper. ISBN 0-8213-0754-1. JEL 87-0892

A partial outgrowth of two symposia held in October 1984, one at the World Bank and the other at the Food and Agriculture Organization in Rome. Three papers address two important problems faced by countries, especially Mediterranean, that are looking to agriculture as a source of foreign exchange and are seeking to produce high value crops. The first, these countries must be aware of similar plans by other nations to avoid market saturation and second, as the EEC expands southward to include Greece, Portugal, and Spain, the products of these nations will compete with those of other Mediterranean-rim producers. After an overview describing the development of horticulture trade, the EEC trade system, and World Bank projects, the role of fruits and vegetables in the EEC is described. Outlines the methodology used in projecting price and trade changes and gives the results for twenty products—ten for vegetables (annual crops) and ten for fruit (perennials). The third paper presents a case study of the impact of EEC enlargement on fruits and vegetables. Develops a model to project future patterns of production, consumption, trade, and exports. Bale is with the Country Policy Department, the World Bank. No index.

BAUM, WARREN C. *Partners against hunger: The consultative group on international agricultural research*. With the collaboration of MICHAEL L. LEJUENE. Washington, D.C.: World Bank for the Consultative Group on International Agricultural Research, 1986. Pp. xiii, 337. \$29.95, cloth; \$10.95, paper. ISBN 0-8213-0828-9, pbk.

JEL 87-0893

History of the Consultative Group on International Agricultural Research (CGIAR). Traces the origins of modern agricultural research and the formation of several international agricultural research centers. Examines the initiatives for mobilizing the aid community during 1969-1971 leading up to the formation of CGIAR. Outlines the process

of formulating and consolidating the system during the succeeding years and highlights the roles, successes, and failures of different centers and organizations under CGIAR. Reviews the evolution of CGIAR between 1971-85 in terms of changes in the organization's internal structure as well as its impact on agricultural techniques and yields. Describes the organization, management, and governance of the CGIAR centers. Discusses research priorities, funding, organization, participation and international status. Concludes with an evaluation of the impact and replicability of CGIAR. Baum is a vice president of the World Bank. Index.

DANTWALA, M. L., ET AL. *Indian agricultural development since independence: A collection of essays*. New Delhi: Oxford and IBH, 1986. Pp. viii, 519. Rs. 135. ISBN 81-204-0118-2. JEL 87-0694

Twenty-one papers, specially contributed by senior agricultural economists in India, review developments in agriculture in India since the initiation of planning and highlight major policy issues that have arisen in the process of plan implementation. Ten papers consider the strategy of agriculture since independence, the role of agriculture in the national economy, agrarian structure and agrarian relations, irrigation and water use, the pace and pattern of the growth of agricultural production, technological development, animal husbandry, and allied enterprises (poultry, fisheries, and forestry). Six papers discuss institutional aspects of saving and capital formation in the agricultural sector, credit for agriculture and rural development, marketing, public intervention in agricultural marketing, price policy and terms of trade, and farm prices. The remaining five papers examine taxation and subsidies, agricultural labor and rural employment, trade in agricultural commodities from 1960 to 1990, rural development approaches and issues, and rural development administration. Dantwala is Professor Emeritus, Department of Economics, University of Bombay. Index.

DESAI, PADMA. *Weather and grain yields in the Soviet Union*. Research Report series, no. 54. Washington, D.C.: International Food Policy Research Institute, 1986. Pp. 94. Paper. ISBN 0-89629-055-7. JEL 87-0695

Analyzes the extent to which Soviet grain yields are affected by weather as opposed to other factors more susceptible to manipulation by policy. The focus is on the four republics in the Soviet grain belt (the Ukraine, Belorussia, Kazakhstan, and the Russian Republic) and the unit of analysis is the oblast. Estimates weather-yield models that use grain yields from 1958-75 and precipitation and

temperatures in the critical months of the crop cycle and then estimates the weather variability of yield for the country as a whole from 1955 to 1982. Finds that weather has had only a moderately large effect on yield variation and that policy and systemic effects on yield became larger between 1968 and 1982 with agricultural policy changes. Also discusses the possible conflict between the importation of increasing amounts of grain by the Soviets and the import needs of grain deficit developing countries. Desai is a professor in the Economics Department and in the Harriman Institute, Columbia University. Bibliography; no index.

JARVIS, LOVELL S. *Livestock development in Latin America*. Washington, D.C.: World Bank, 1986. Pp. x, 214. \$10.95, paper. ISBN 0-8213-0756-4. JEL 87-0696

Study of Latin American livestock sector development commissioned by the World Bank in 1982. Presents empirical data and discusses economic policy issues, focusing on the beef and dairy industries. Examines meat and milk consumption in Latin America, livestock production, international trade in Latin American livestock products, World Bank lending for livestock projects, and the role of the government and the livestock sector. Identifies future issues in the development of the livestock sector as protection, uncertainty, and instability in world beef markets; the tradeoff between producer and consumer welfare; domestic milk production and milk imports; dual-purpose cattle production; the control and eradication of foot and mouth disease; the improvement of pastures; research; livestock development in the Amazon Region; improved technical assistance programs; and animal and product grading. Jarvis is Associate Professor, Department of Agricultural Economics, University of California, Davis. Bibliography; index.

JIGGINS, JANICE. *Gender-related impacts and the work of the international agricultural research centers*. Consultative Group on International Agricultural Research (CGIAR) Study Paper, no. 17. Washington, D.C.: World Bank, 1986. Pp. x, 95. \$5.00, paper. ISBN 0-8213-0840-8. JEL 87-0697

Studies the work of the International Agricultural Research Centers (IARCs) and the impact of technical change in agriculture on women. Begins by considering why gender issues matter. Finds increasing evidence from agricultural project and program evaluations that insufficient attention to gender issues has tended to reinforce inequities that hold productivity and welfare below their potential. Notes that major socioeconomic changes

are affecting patterns of household formation and obligations, shown by differential scales of male/female migration, increasing number of single households headed by women in the remote and poorer areas, and the growth of female headed households. Finds that female production is substantial, but undercounted and undervalued. Criticizes the IARCs for being too conservative, hesitant, and cautious with respect to gender issues. Parts 2 and 3 examine questions and describe the methodology. Discusses three main areas of concern: gender based barriers to female access to extension services, differentials in male/female professional agricultural education and training, and the tendency for knowledge about female roles in the food system to be ignored. Uses three geographical areas for empirical analysis—Asia, Latin America and the Caribbean, and sub-Saharan Africa. Jiggins is a rural development consultant residing in the Netherlands. Bibliography; no index.

MAUNDER, ALLEN AND RENBORG, ULF, eds. *Agriculture in a turbulent world economy: Proceedings of the nineteenth international conference of agricultural economists, held at Málaga, Spain, 26 August–4 September 1985*. Aldershot, England and Brookfield, Vt.: Gower, 1986. Pp. xvi, 820. \$55.95. ISBN 0-566-05225-3. JEL 87-0898

Sixty-six papers and discussions presented at an international conference of agricultural economists. The opening addresses deal with the relationship between food, economics, and entitlements and the scope of agricultural economics. In nine parts dealing with the forces shaping the future of agricultural development; the nature of the growing interdependencies and uncertainties in the world economy and their implications; the challenges of balancing overproduction and malnutrition; the conflicts created by increasing pressure on natural resources; the role of human capital, technology, and institutions; the structure of agriculture and people in rural societies, the nature of agricultural markets and trade; recent theoretical developments; and implications for policy and research. A synoptic paper discusses the status and state of agricultural economics. The contributors are mainly agricultural economists. Maunder is associated with the Institute of Agricultural Economics at the University of Oxford. Renborg is a member of the Department of Economics and Statistics, Swedish University of Agricultural Sciences, Uppsala. Index.

MELLOR, JOHN W.; DELGADO, CHRISTOPHER L. AND BLACKIE, MALCOLM J., eds. *Accelerating food production in sub-Saharan Africa*. Baltimore and London: Johns Hopkins University Press for the

International Food Policy Research Institute, Washington, D.C., 1987. Pp. xix, 417. \$39.50. ISBN 0-8018-3390-6. JEL 87-0899

Twenty-eight papers presented at a conference on accelerating food production in Africa in Victoria Falls, Zimbabwe, in August 1983. Part 1 defines the food and nutrition problem in sub-Saharan Africa in terms of production and nutritional needs. Part 2 outlines potential and practice in food production technology development. Part 3 deals with support systems for agricultural development. Part 4 examines food policy in the context of national development strategies. Part 5 assesses donor assistance strategies and part 6 presents priorities for accelerating food production growth in sub-Saharan Africa. The contributors are mainly economists. Mellor is Director and Delgado is Co-coordinator of African Research both at the International Food Policy Research Institute in Washington, D.C. Blackie is Professor of Agricultural Economics at the University of Zimbabwe. Index.

MUNASINGHE, MOHAN. *Rural electrification for development: Policy analysis and applications*. Boulder, Colo. and London: Westview Press in cooperation with the State University of New York, Stony Brook, Institute for Technology Policy in Development, 1987. Pp. xxiii, 440. \$36.50, paper. ISBN 0-8133-0088-6. JEL 87-0900

Explains how rural electrification may be used effectively to improve the quality of life in third world nations. Introduces rural electrification and provides an national perspective on rural electrification policy. Reviews project evaluation and benefit measurement and examines power system optimization and choice of technology. Considers distribution system losses, and engineering standards and design criteria. Examines demand analysis and pricing policy. Presents case studies of policy analysis in Indonesia and Brazil, pricing policy and project evaluation in Malaysia, optimization of supply quality in Costa Rica, and optimization of reliability and losses in India. Concludes with an evaluation of decentralized rural energy supply technologies. Munasinghe is head of Energy Policy Development at the World Bank. Bibliography; index.

OYEJIDE, T. ADEMOLA. *The effects of trade and exchange rate policies on agriculture in Nigeria*. Research Report series, no. 55. Washington, D.C.: International Food Policy Research Institute, 1986. Pp. 61. Paper. ISBN 0-89629-056-5. JEL 87-0901

Examines the effects of economy-wide trade and exchange-rate policies on agriculture and the extent to which Nigeria's oil boom has adversely af-

affected both food and export-crop components of agriculture. Focuses on the period from 1960-82, looks at the degree of protection granted to agriculture compared to other sectors, and assesses how these policies affected the allocation of resources both within agriculture and among the other sectors. Specific topics include: an overview of the structure and growth of Nigerian agriculture, a survey of economic policies, use of agricultural price interventions and incentives, application of models of the Dutch Disease phenomenon to the Nigerian situation, and the effects of trade and exchange-rate policy responses on Nigerian agriculture. General conclusions are that the oil boom adversely affected Nigeria's agriculture and that both the Dutch Disease phenomenon and the trade and exchange-rate regime taxed rather than protected agriculture. Oyejide is head of the Department of Economics, University of Ibadan, Nigeria. Bibliography; no index.

PUTTERMAN, LOUIS. *Peasants, collectives, and choice: Economic theory and Tanzania's villages*. Contemporary Studies in Economic and Financial Analysis: An International Series of Monographs, vol. 57. Greenwich, Conn. and London: JAI Press, 1986. Pp. xviii, 389. \$24.75. ISBN 0-89232-684-0.

JEL 87-0902

Examines the role of economic motivation in influencing the evolution of the village-level economy in Tanzania and analyzes problems encountered in Tanzania's aim to transform itself into a nation of rural, collective villages. Explores the voluntary collectivization hypothesis, i.e., that peasant transition to collective agriculture can take place without external coercion when it is in the peasants' individual and joint interests, and develops a formal model of the economic structure of a transitional village community of the voluntary, gradualistic, and democratic type proposed by ex-President Julius Nyerere for Tanzania. Analyzes the individual and collective choice dimensions of the transition from peasant to collective agriculture and tests the applicability of the theoretical framework. The conclusion discusses organizational and motivational problems, social oppositions existing at the local and national political economy levels, and economies of scale problems. Putterman is in the Department of Economics, Brown University. Index.

ROBERTSON, A. F. *The dynamics of productive relationships: African share contracts in comparative perspective*. Cambridge; New York and Melbourne: Cambridge University Press, 1987. Pp. xix, 331. \$44.50. ISBN 0-521-32834-9.

JEL 87-0903

Focuses on share contracting in which two or more parties agree to combine their privately held resources in a productive enterprise and share the output in prearranged proportions. Argues that given the inherent instability of the family as a productive unit and many centuries of erratic economic growth worldwide, certain relations of production, including share contracting, have taken root because they are flexible and adaptable. Notes importance of sharecropping in agriculture because it extends the limits of production beyond the capabilities of a single family while spreading risks. Argues that empirical inquiry into this practice in Asia and Latin America reveals that sharecropping can accommodate innovation readily, produce high yields, and help redistribute productive resources and wealth. Examines four African cases—Ghana, the Sudan, Lesotha, and Senegambia—to explain how these arrangements have mediated between the needs and capacities of farming households, the demands of subsistence and profitable investment, and the leveling processes of resource redistribution, and the resolution of rural society into discrete classes. Contrasts African experience with other areas. Robertson is at the University of California, Santa Barbara. General and regional bibliography; Index.

SARMA, J. S. *Cereal feed use in the third world: Past trends and projections to 2000*. Research Report series, no. 57. Washington, D.C.: International Food Policy Research Institute, 1986. Pp. 68. Paper. ISBN 0-89629-058-1.

JEL 87-0904

Analyzes past trends in the use of cereal feeds in 104 developing countries and relates these to past trends in the output of livestock products. Discusses the cereal feed situation in 1980 and trends in cereal feed use. Examines the growth in cereal feed use in Taiwan and the Republic of Korea, and the dynamics of demand for food and feedgrains in selected developing countries. Provides a projection of cereal feed use to the years 1990 and 2000 using five alternative approaches. Concludes that with the continuation of past trends in production and per capital income, developing countries (excluding China) would have an overall net food deficit of 76 million tons of basic food staples, including cereals and other major food crops, by the end of the century. Sarma is a research fellow at the International Food Policy Research Institute. Bibliography; no index.

SCOTT, GREGORY J. *Marketing Bhutan's potatoes: Present patterns and future prospects. A potato marketing/demand case study*. Lima: International Potato Center (CIP), 1983. Pp. vii, 80. \$3.00, paper.

JEL 87-0905

Marketing survey of Bhutanese potatoes conducted in India, Bangladesh, and Bhutan in October and November 1982. Describes the role of potatoes in the economic development of Bhutan; focuses on potato production and consumption, prevailing marketing patterns, and government institutions and marketing policies. Presents an analysis of existing foreign and domestic marketing patterns and assesses constraints and prospects for table and seed potatoes produced by Bhutan. A general conclusion is that greater potato production and marketing can help Bhutan meet its development goals of achieving food self-sufficiency and raising farmers' incomes. Contains recommendations pertaining to: market promotion, information, and research; market infrastructure, administration, and personnel; and marketing policy and food self-sufficiency. Scott is a potato marketing specialist, International Potato Center, Lima. No index.

UNITED NATIONS ECONOMIC COMMISSION FOR EUROPE, FAO/ECE AGRICULTURE AND TIMBER DIVISION. *Agricultural review for Europe series, no. 28, 1984 and 1985. Volume 1. General review.* U.N. Sales Publication No. E.86.II.E.14. New York: United Nations, 1986. Pp. iii, 81. \$9.50, paper. ISBN 92-1-116361-7. JEL 87-0906

Presents 1985 available data or provisional estimates of agricultural developments and indices for changes between 1984 and 1985 for individual countries, the EEC, and CMEA. Contains a summary review, twenty-one summary tables for several countries in Western Europe and Eastern Europe as well as Canada and the United States, and an overview of agricultural policy developments in the ECE region. Provides information about agricultural holdings and active agricultural population, value and volume of production, area under grains, grain yields, total grain production, and potato, sugar beet, vegetable and fruit, wine and oilseed, fiber crop, feed, livestock, meat, milk and dairy products, and eggs and wool production as well as agricultural prices and net product and agricultural trade. The policy overview considers policy aims and objectives, medium- and long-term plans, orientation of production, price policy, agricultural inputs, energy, income support, promotion of investments, land and other structural policies, organization of producers and production, marketing and market organization, education, training, research, and social, environmental, and trade policies. Also available in French, Russian, and Spanish. No index.

ZAMOSC, LEON. *The agrarian question and the peasant movement in Colombia: Struggles of the National Peasant Association, 1957-1981.* Cambridge Latin American Studies series, no. 58. Cambridge:

New York and Melbourne: Cambridge University Press; Geneva: United Nations Research Institute for Social Development, 1986. Pp. xx, 289. ISBN 0-521-32010-0. JEL 87-0907

Analysis of the Colombian peasant movement during the 1970s. Details the historical antecedents of the agrarian question and traces the structural contradictions that emerged after the civil war. Explores the political environment for the emergence of a peasant movement in the 1960s and the events leading to the creation of the Asociación Nacional de Usuarios Campesinos (ANUC). Discusses the development of the peasant movement, the role of ANUC during the land invasions in 1971, the subsequent evolution of the movement, and the role of repression and state policy as well as the politicization of the struggle. Examines the changes in the peasant's strategy as a result of broad socio-economic changes and the factors leading to the decline and final crisis in the peasant movement. Assesses the outcome of this crisis in the early 1980s and the overall effect of the movement. Zamosc is with the Department of Sociology at the University of California, San Diego. Bibliography; index.

ZIN, KYAW. *Burma and the CGIAR centers: A study of their collaboration in agricultural research.* Consultative Group on International Agricultural Research (CGIAR) Study Paper, no. 19. Washington, D.C.: World Bank, 1986. Pp. xiv, 105. \$5.00, paper. ISBN 0-8213-0861-0. JEL 87-0908

Studies the collaboration between International Agricultural Research Centers (IARCs) and the agricultural research system in Burma. Main objectives are to review the collaboration between the Consultative Group on International Agricultural Research (CGIAR) and the IARCs; to assess how international inputs have contributed to national research capacity; to evaluate the relevance of training programs; to summarize the impact on food production; and to describe how technological changes have been transmitted to farmers. Describes the country, its geography, political environment, and population, and reviews the agricultural sector, focusing on the infrastructure, performance, and pricing. Discusses the research system and its impact on a variety of crops. Zin is former Vice Chancellor of the Institute of Agriculture at Yezin, Burma. No index.

## 720 NATURAL RESOURCES

[ADELMAN, M. A.] *Energy: Markets and regulation. Essays in honor of M. A. Adelman.* Edited by

RICHARD L. GORDON, HENRY D. JACOBY, AND MARTIN B. ZIMMERMAN. Cambridge, Mass. and London: MIT Press, 1987. Pp. xxi, 394. \$37.50. ISBN 0-262-07103-7. JEL 87-0909

Thirteen papers written by former students and current colleagues in honor of Morris A. Adelman for his contributions to the understanding of industrial organization and antitrust policy, the economics of natural resource discovery, and the world petroleum market. Papers focus on energy regulation, world energy markets, oil and gas supply, and energy demand. Topics include: adapting to change in natural gas markets in the United States, U.S. oil policies and Canadian oil pricing, coal policy in major producing countries, the evolution of civilian nuclear power in the U.S., the record of the Environmental Protection Agency in controlling industrial air pollution, public policy and the private automobile, the evolution of oil as a commodity, cartel theory and experience in international minerals markets, tax developments in the world oil market, oil tanker markets, oil and gas resource and supply assessment, cost and output analysis in mineral and petroleum production, and a survey of research about relationships between energy price shocks and productivity growth. The contributors besides the editors, are mainly economists and management specialists. Gordon is Professor of Mineral Economics, Pennsylvania State University. Jacoby is Professor of Management, Massachusetts Institute of Technology. Zimmerman is Associate Professor of Economics, University of Michigan. Index.

BROWN, LESTER R., ET AL. *State of the world 1987: A Worldwatch Institute report on progress toward a sustainable society*. Edited by LINDA STARKE. State of the World series. New York and London: Norton, 1987. Pp. xvii, 268. \$18.95, cloth; \$19.95, paper. ISBN 0-393-30389-6, pbk. JEL 87-0910

Eleven articles highlight the risks that confront societies and indicate avenues for preemptive policies and actions. Topics include thresholds of ecological change, divergences in population growth, the future of urbanization, reassessing nuclear power particularly after Chernobyl, electrifying the third world, the potential of recycling, sustaining world agriculture, raising agricultural productivity, stabilizing chemical cycles, and designing and charting a sustainable economic course. Problems examined include pollution and gas emissions, absorption of waste, and the effect of privatization on the efficiency of resource use. Authors are staff members of the Worldwatch Institute. Index.

COHEN, FAY G. *Treaties on trial: The continuing controversy over Northwest Indian fishing rights*.

With contributions by JOAN LA FRANCE AND VIVIAN L. BOWDEN. Introduction by ANDY FERNANDO. Seattle and London: University of Washington Press for the American Friends Service Committee, Seattle, 1986. Pp. xxvi, 229. \$20.00, cloth; \$9.95, paper. ISBN 0-295-96268-2, pbk. JEL 87-0911

Describes the circumstances leading to the Boldt Decision resulting from the United States versus Washington, a 1974 legal case, which recognized tribal rights to half the harvestable salmon destined for traditional fishing places in Washington state waters and assesses its consequences and significance. Considers the evolution of events leading up to Judge Boldt's ruling, the 1979 U.S. Supreme Court affirmation of the decision, problems with implementing the ruling, the negotiations involved in resolving the more recent Indian fishing controversy on the Columbia River, environmental threats to the salmon resource, and how the tribes and fish are faring today given the narrow passage of Initiative 456 that would declare treaty rights unconstitutional. Cohen is Associate Professor, Institute for Resource and Environmental Studies, Dalhousie University, Halifax, Nova Scotia. Index.

CROUCH, G. J. *The development of the Australian tuna industry*. Research Monograph series, no. 24. Sydney: University of Sydney, Transnational Corporations Research Project, 1987. Pp. 97. Paper. ISBN 0-908470-73-8. JEL 87-0912

Part of the Pacific Islands Development Program project entitled Multinational Corporations in the Pacific Tuna Industry, supported by the East-West Center in Honolulu and the United Nations Development Programme. Divided into three parts: the development of the industry and the evolution of government policies; corporate involvement in the fishing and processing sections; and the retail market for tuna in Australia. Finds that increased involvement of the federal government in fisheries management has resulted in many arrangements incorporating a high degree of national and international cooperation with the intent of stabilizing the industry and preserving the resource. Presents a detailed accounting of the industry, beginning in 1936 and 1938 with the establishment of small canneries. Reviews government policies such as the use and end of limited entry, quotas, and negotiations with the United States and Japan. Crouch is Research Fellow in the Transnational Corporations Research Project. No index.

FREDERICK, KENNETH D., ed. *Scarce water and institutional change*. With the assistance of DIANA C. GIBSON. Washington, D.C.: Resources for the Future; distributed by Johns Hopkins University

Press, 1986. Pp. xii, 207. ISBN 0-915707-21-7.

JEL 87-0913

Examines alternative ways for meeting long-term water needs in the United States. Contains water management case studies that focus on areas experiencing problems with projected water needs or with allocating scarce supplies among competing uses (Pacific Northwest; Kern County, California; the coastal area of southern California, and south-eastern Virginia) and on an innovative institutional arrangement (the Colorado-Big Thompson Project). Case studies consider: the role of institutional factors, especially water laws and administrative arrangements, in creating and solving a region's water problems; the factors that promote or inhibit flexibility for responding to changing water supply and demand; the potential role of markets and prices for allocating scarce water supplies and creating incentives to conserve water; and institutions and conditions that encourage water marketing. The overview chapter by the editor highlights principal factors that influence how a nation uses and abuses its waters, important issues in need of resolution, and the role of water markets; also contains comments on the lessons to be learned from the case studies. The contributors are mainly economists and environmental resources specialists. Frederick is Senior Fellow and Director of the Renewable Resources Division, Resources for the Future Inc., Washington, D.C. Gibbons is a consultant to the World Resources Institute on the Arid Lands Project. Index.

GIBBONS, DIANA C. *The economic value of water*. Washington, D.C.: Resources for the Future; distributed by Johns Hopkins University Press, 1986. Pp. xii, 101. Paper. ISBN 0-915707-23-3.

JEL 87-0914

Provides a framework for understanding water values and summarizes empirical evidence of the value of water according to different uses. Examines the demand for and value of water use in the United States in seven different sectors, i.e., municipalities, irrigation, industry, waste assimilation, recreation and aesthetics, navigation, and hydropower. Explores the conceptual basis for water values in each sector as well as the methods of estimating those values. Also presents values calculated for the present study. Each sector analysis chapter concludes with comments and caveats about the estimates and a discussion of policy issues. The epilogue comments on the lack of legal and institutional mechanisms for facilitating transfers between uses that perpetuate economic inefficiencies. Gibbons is a consultant to the World Resources Institute on the Arid Lands Project. No index.

KLAPP, MERRIE GILBERT. *The sovereign entrepreneur: Oil policies in advanced and less developed capitalist countries*. Cornell Studies in Political Economy series. Ithaca and London: Cornell University Press, 1987. Pp. 244. \$27.50. ISBN 0-8014-1997-2.

JEL 87-0915

Provides a comparative national perspective on oil politics, particularly from 1960 to 1985. Complements product cycle and international bargaining theory, which focuses mainly on international relations among multinational corporations, banks, and governments. Examines the role of the state mainly at the national level, focusing on the struggles of international actors in domestic business, labor, political parties, and special interest groups. Draws from bureaucratic theory on the politics of management, budget, and allocation of property rights within the state. Emphasizes the capacity of the state to pursue policy objectives through state enterprises, as an answer to why governments in seventy-four countries have become entrepreneurs in the oil industry. Evidence is drawn primarily from case studies of Norway, Britain, Indonesia, and Malaysia, in which representatives of government, international organizations, industry associations, corporations, and trade unions were interviewed. Concludes with a discussion of perspectives on the role of the state. Klapp is Assistant Professor of Urban Studies and Planning at the Massachusetts Institute of Technology. Index.

MCCOLL, G. D. *Energy and economic development: The world and South East Asia*. Center for Applied Economic Research, CAER Paper series, no. 23. Kensington, Australia: University of New South Wales, 1986. Pp. 83. Paper. ISBN 0-85823-584-6.

JEL 87-0916

Reviews world energy trends and projections related to the demand for and supply of major forms of energy since the 1973 increase of crude oil prices by OPEC. Highlights trends in energy consumption, i.e., oil's declining share relative to coal, natural gas, and uranium; changes in international trade between producers and consumers; and changes in reserve/production ratios. Examines energy developments, projections, and forecasting assumptions of energy demand for the OECD countries and for the less developed countries of Southeast Asia (Brunei, China, Indonesia, Korea, Malaysia, the Philippines, Singapore, Taiwan, and Thailand). Overviews prospects for world energy consumption, production, and trade until the year 2000. Concludes with a review of the major uncertainties associated with projections of future demand and supply. The Southeast Asia section relies on papers presented at the World Energy Conference's Southeast Asia and Pacific Regional Symposium,

1986. McColl is Research Associate, Center for Applied Economic Research, University of New South Wales. No index.

RUSSELL, CLIFFORD S.; HARRINGTON, WINSTON AND VAUGHAN, WILLIAM J. *Enforcing pollution control laws*. Washington, D.C.: Resources for the Future, 1986. Pp. xiii, 231. ISBN 0-915707-25-X.

JEL 87-0917

Describes the current state of air and water pollution monitoring and enforcement activity. Addresses two major questions; what type and how much monitoring is being done? and what enforcement policies are being pursued? Discusses the legal and technological aspects of monitoring and enforcement, addressing questions such as how the law has dealt with statistical errors, how entry may be gained to a polluter's premises, how off-premises monitoring equipment is used, and the costs of monitoring. Examines the economics of monitoring and enforcement. Discusses statistical problems as associated with quality control and willful noncompliance. A major conclusion is that the emphasis in law and regulation on achieving the installation of treatment technologies (initial compliance) has been overdone and that measures of actual performance are needed. Russell is Director of the Vanderbilt University Institute for Public Policy Studies. Harrington is a Fellow at Resources for the Future. Vaughan is an economist with the Inter-American Development Bank. Index.

UNITED NATIONS DEPARTMENT OF INTERNATIONAL ECONOMIC AND SOCIAL AFFAIRS. *Methodologies for assessing the impact of deep sea-bed minerals on the world economy*. U.N. Publication Sales No. E.86.II.A.13. New York: United Nations, 1986. Pp. ix, 153. \$16.50, paper. JEL 87-0918

Considers economic and technical issues related to the development of marine mineral resources in connection with the role of nonrenewable resources and their impact on the economies of developing countries as well as on the world economy. Centers on materials and papers submitted to, and resulting from, an Expert Group Meeting on the Impact of Sea-Bed Minerals on the World Economy convened at the U.N. Headquarters in New York in January 1983. Part 1 contains an analysis of the impact of sea-bed minerals on the world economy; part 2 is the Expert Group report and recommendations. Some specific topics are: the role of the metals contained in sea-bed minerals within the world economy; potential impact of price and production costs, location of mining, distribution of costs and benefits, and trade patterns of sea-bed minerals on the world economy; and issues and perspectives related to the development

of a quantitative framework for analyzing their potential impact. Also available in French, Russian, and Spanish. Bibliography; no index.

UNITED NATIONS DEPARTMENT OF TECHNICAL CO-OPERATION FOR DEVELOPMENT, FOOD AND AGRICULTURE ORGANIZATION. *Water resources legislation and administration in selected Caribbean countries*. Natural Resources/Water Series, no. 16. U.N. Publication Sales No. E.86.II.H.2. New York: United Nations, 1986. Pp. iv, 171. \$16.50, paper. ISBN 92-1-123105-1. JEL 87-0919

Examines the legal and institutional issues involved in the development, conservation, and use of water resources in smaller English-speaking Caribbean islands of Antigua and Barbuda, the Cayman Islands, Montserrat, St. Kitts and Nevis, and St. Vincent and the Grenadines, as well as the larger islands of Jamaica, the Dominican Republic, and Haiti. Considers: background and setting; current legislation pertaining to water resources; ownership and control status of water; priorities; right to use water; beneficial uses of the water supply; harmful effects of water; waste, pollution, and mosquito control; legislation on groundwater resources; control and protection of waterworks and structures, protected areas; government water resources administration; autonomous and semi-autonomous water development agencies; financial aspects; and enforcement and implementation. Also available in French, Russian, and Spanish. No index.

UNITED NATIONS OFFICE OF THE SPECIAL REPRESENTATIVE OF THE SECRETARY-GENERAL FOR THE LAW OF THE SEA. *The law of the sea: National legislation on the exclusive economic zone, the economic zone and the exclusive fishery zone*. U.N. Publication Sales No. E.85.V.10. New York: United Nations, 1986. Pp. xv, 337. \$35.00, paper. ISBN 92-1-133272-9. JEL 87-0920

Presents relevant provisions of the U.N. Convention on the Law of the Sea on the exclusive economic zone (articles 55-75) adopted in 1982, and compiles the existing national legislation of seventy-eight countries pertaining to the exclusive economic zone, the economic zone, and the exclusive fishery zone, including declarations thereon. The introduction discusses the meaning and intention of the exclusive economic zone and settlement of disputes. Also available in French, Russian, and Spanish. No index.

VIETOR, RICHARD H. K. *Energy policy in America since 1845: A study of business-government relations*. Studies in Economic History and Policy, the

United States in the Twentieth Century series. Cambridge; New York and Melbourne: Cambridge University Press, 1984. Pp. xvii, 363. \$12.95. ISBN 0-521-33572-8. JEL 87-0921

Presents the history of fossil-fuel energy policy in the United States since World War II and provides a useful framework for understanding how business and government interact. Points out that government intervention has been the norm in the energy industries, affecting production, importation, and consumption, thereby fostering the energy conditions that prevail currently. Integrates the economics and public policy of the coal, petroleum, and natural gas industries along with developments in synthetic fuels. Presents analysis in three periods corresponding to conditions of energy supply and price that affected issues of public policy: 1945-58, during which the U.S. shifted from primary dependence on solid fuels to fluid fuels; 1959-68, a decade of relative stability in price and market share for the three fuels; and 1969-80, which witnessed the depletion of domestic reserves of petroleum and natural gas. Concludes that the government's domestic policies for fossil fuels generally failed resulting in reduced economic efficiency, temporary and misleading stabilization of markets, and little or no benefit to national security. Vietor is a Professor in the School of Business Administration at Harvard University. Index.

WEYMAN-JONES, THOMAS G. *Energy in Europe: Issues and policies*. The Methuen EEC Series. London and New York: Methuen, 1986. Pp. xii, 176. \$55.00. ISBN 0-416-36590-6. JEL 87-0922

Presents a framework for the economic analysis of energy issues and policies from a European perspective, especially the European Economic Community (EEC), based on the assumption of unavoidable dependence on imported oil by the EEC. Presents a detailed review of the oil shocks, 1973-74, with rising real oil prices; 1979-80, with continued increases associated with the Iranian revolution; and 1982-86, with erosion in real oil prices. Discusses the consequent oil price movements and their effects on European economies, emphasizing the importance of differences between long- and short-run effects. Assesses the role of conservation and pricing policies. Examines the position of Europe as both a supplier and consumer in the world oil market. Discusses the economic, political, and social impact of investment in nuclear power, oil and gas discoveries (particularly North Sea), Soviet gas imports, and coal. Concludes with a projection of the evolving balance by the year 2000, noting that many issues in energy policy remain unresolved. Weyman-Jones is a Lecturer in Economics

at Loughborough University of Technology. Index.

### 730 ECONOMIC GEOGRAPHY

DAVIES, H. R. J., ed. *Natural resources and rural development in arid lands: Case studies from Sudan*. Tokyo: United Nations University, 1985. Pp. x, 84. \$10.00, paper. ISBN 92-808-0504-5. JEL 87-0923

Four case studies examine the results of the effort for agricultural development in Sudan. Each study considers a current problem in the use of natural resources in the semi-arid lands and examines the participants' reactions to particular changes or aspects of the environment. Topics are: the production of dura (sorghum vulgare) in Sudan and the parasite huda (*Striga hermonthica*); the impact of improved rural water supplies in the East Kordofan district; wood resources and their use in the Nuba Mountains; and planners' and participants' perceptions of development in the semi-arid lands of Sudan with special reference to the Khashm el Girba Scheme. The conclusion by the editor summarizes the main factors found to inhibit rural change in the arid lands. The editor is Senior Lecturer, Department of Geography, University of Swansea, Wales. Glossary; no index.

### 800 Manpower; Labor; Population

#### 810 MANPOWER TRAINING AND ALLOCATION; LABOR FORCE AND SUPPLY

COLLARD, BETSY A. *The high-tech career book: Finding your place in today's job market*. Los Altos, Calif.: Kaufmann, 1986. Pp. xiii, 273. Paper. ISBN 0-86576-095-0. JEL 87-0924

A guide to jobs and career opportunities in high-technology companies in the Silicon Valley, California. Aimed primarily at people without technical backgrounds, it provides information to aid them in transferring their skills and planning careers in high technology. Part 1 covers the organization of high-tech companies. Part 2 is devoted to careers in functional areas and includes discussion of careers in engineering, marketing, sales and service, operations, materials, finance, management information systems, human resources, and general administration. Part 3 discusses careers in writing, training, graphics and public relations. Part 4 outlines sources for obtaining job and company information and methods of getting started and moving industries. Collard is the Director of Employment

Services at the Resource Center for Women in Palo Alto, California. Glossary; index.

DEX, SHIRLEY. *Women's occupational mobility: A lifetime perspective*. New York: St. Martin's Press, 1987. Pp. xi, 157. \$27.50. ISBN 0-312-88789-2.

JEL 87-0925

Presents the results of an analysis of information from the *Women and Employment Survey* conducted in 1980. The Survey was the first systematic large-scale recording of female employment history over a lifetime span, containing employment histories of 5,320 women between ages 16 and 59. Indicates the importance of information about female employment to help resolve policy issues about equal opportunities for women and academic debates about the nature of women's careers and women's positions within the structures, relations, and processes of employment. Documents female employment by occupation, industry, labor market, and class. Examines the patterns of female employment over time and discusses female lifetime occupational mobility. Provides industrial profiles and investigates industrial mobility among females. Concludes with a discussion of the structure of women's careers. Dex is Lecturer in Economics at the University of Keele. Bibliography; index.

MALLIER, A. T. AND ROSSEN, M. J. *Women and the economy: A comparative study of Britain and the USA*. Foreword by BARONESS SEAR. New York: St. Martin's Press, 1987. Pp. xiii, 221. \$29.95. ISBN 0-312-88732-9.

JEL 87-0926

Summarizes statistical evidence and economic explanations of the changes in the women's labor force participation in Britain and the United States since 1900; emphasis is on the most recent research. Overviews long-term trends since 1900, i.e., changes in the industrial and occupational distribution of the female labor force and in the relationships between the growth of the female labor force, population increases, and other demographic changes. Examines factors that affect the demand and supply of female labor as well as equal opportunity and pay, part-time employment, unemployment, and the effects of new technology. Presents international comparisons of changes in the female labor force in free market industrialized economies and the Soviet Union. The final chapter surveys findings arrived at using the Marxian model of economic analysis. The authors are Senior Lecturers in Economics, Coventry (Lanchester) Polytechnic. Selected bibliography; author and subject indexes.

## 820 LABOR MARKETS; PUBLIC POLICY

ADAM, JAN, ed. *Employment policies in the Soviet Union and Eastern Europe*. Second revised edition. New York: St. Martin's Press, [1982] 1987. Pp. xviii, 224. \$30.00. ISBN 0-312-24463-0.

JEL 87-0927

A second edition, revised and updated, contains nine essays. Revisions reflect changes that have occurred in the five countries under review—the Soviet Union, Poland, East Germany, Czechoslovakia, and Hungary. [For annotation of the first edition, see JEL no. 83-0846.] The article on Poland contains the greatest amount of revision because of its experience with political and economic crises since the first edition. Two articles are new: one dealing with the role of pensioners coping with labor shortages in the U.S.S.R., especially since the number of pensioners is increasing, and the other a historical analysis of employment policies in Hungary. The contributors are mainly economists. Adam is Professor of Economics at the University of Calgary. Index.

GINZBERG, ELI. *Understanding human resources: Perspectives, people, and policy*. Lanham, Md. and London: University Press of America, Abt Books, 1985. Pp. xvii, 744. \$34.25. ISBN 0-8191-4860-5.

JEL 87-0928

Brings together representative pieces of research by the author, spanning half a century, focusing on the role of human resources. Divided into ten parts providing selections from most of the areas of human resources and manpower in which Ginzberg has been engaged. Topics include: economic doctrine and reality; career choice and performance potential; the unsuccessful, such as the unemployed; women, including women in the work force and reentry; older persons, reviewing early retirement and the social security system, blacks, noting their potential and career choices; technology and the changing economy, human resource management in large organizations; metropolitanism: focus on New York, and programs and policy including areas such as social programs, federal training, manpower, and the disadvantaged. Ginzberg is at Columbia University. Bibliography; index.

HUNT, H. ALLAN AND HUNT, TIMOTHY L. *Clerical employment and technological change*. Kalamazoo, Mich.: Upjohn Institute for Employment Research, 1986. Pp. x, 296. \$23.95, cloth; \$15.95, paper. ISBN 0-88090-049-2.

JEL 87-0929

Addresses concerns about clerical employment trends associated with office automation, particularly related to the displacing capabilities of the

new technology and the elimination of many traditionally female jobs. Raises questions about the decline, whether it has been associated with office automation or whether it was a coincidental happening along with other declining trends in the economy. Reviews clerical employment trends over the past thirty years, using indirect evidence on the impact of technology because direct data on capital inputs are not available. Specifically examines trends from 1950 to 1960 and from 1972 to 1982, assessing the impact of the first computer revolution of the 1960s and 1970s. Investigates the broad economic determinants of clerical employment, emphasizing structural changes. Concludes that the data are insufficient to make a final assessment of the impact of office automation on clerical jobs, especially since other influences with a simultaneous effect took place. The authors are on the staff of the W. E. Upjohn Institute for Employment Research. No index.

KNIGHT, K. G. *Unemployment: An economic analysis*. Totowa, N.J.: Barnes and Noble, 1967. Pp. 411. \$32.50. ISBN 0-388-20661-X. JEL 87-0930

Reviews theoretical developments and presents empirical evidence pertaining to the economics of unemployment with particular reference to the British experience. Concentrates on labor market disequilibrium as a stock of unemployment different from the natural rate. Analyzes the aggregate stock of unemployment and the problems associated with its measurement as well as its degree of concentration and the turnover within it. Considers various approaches that have been used to explain duration and the rate of inflow to unemployment. Examines the role of job search and discusses alternative macroeconomic approaches to the stock of unemployment, i.e., the classical and the nonmarket clearing (Keynesian and recent disequilibrium analysis). Presents the empirical evidence that has been used to support alternative ways of examining unemployment in excess of the natural rate. Considers the supply and demand sides of the natural rate of unemployment. Concludes with an examination of current and alternative economic policies and future prospects, which emphasizes the importance of designing a coordinated and complementary mix of policy instruments because there are multiple causes of unemployment. Knight is Lecturer, Department of Economics, University of Warwick. Bibliography; index.

SHAND, R. T., ed. *Off-farm employment in the development of rural Asia: Papers presented at a conference held in Chiang Mai, Thailand, 23 to 26 August 1983*. Volume 1. Canberra: Australian National

University, National Centre for Development Studies, 1986. Pp. xii, 367. Paper. ISBN 0-86784-713-1. JEL 87-0931

Thirteen papers consider the extent and implications of off-farm employment for the economic development of South, Southeast, and East Asia. Papers examine the relationship between off-farm employment and rural incomes, the rural-urban interface, the distribution of farm household incomes and productivity, and the current status and future prospects of off-farm employment in South Korea, Thailand, Indonesia, and rural Asia as well as policy guidelines and the potential for increasing employment and incomes. The contributors are economists. Shand is a member of the Department of Economics at the Research School of Pacific Studies at the Australian National University, Canberra. No index.

SHAND, R. T., ed. *Off-farm employment in the development of rural Asia: Papers presented at a conference held in Chiang Mai, Thailand, 23 to 26 August 1983*. Volume 2. Canberra: Australian National University, National Centre for Development Studies, 1986. Pp. vi, 249. Paper. ISBN 0-86784-729-8. JEL 87-0932

Eleven papers mainly present case studies of successes and failures at generating off-farm employment in South, Southeast, and East Asia. Topics include: off-farm employment in the Kemubu Project in Malaysia; evolution of sources of income in the Muda Irrigation Scheme; off-farm employment as an antipoverty strategy in Malaysia; composition, growth, and seasonality of such employment in the Philippines; impact of off-farm employment on labor utilization and earnings structure; off-farm employment in India, Bangladesh, and Sri Lanka; and the off-farm economic structure of growing regions—a study of Punjab. The contributors are economists. Shand is a member of the Department of Economics at the Australian National University, Canberra. No index.

TWENTIETH CENTURY FUND TASK FORCE. *The government's managers: Report of the Twentieth Century Fund Task Force on the Senior Executive Service*. Background paper by MARK W. HUDDLESTON. New York: Priority Press, 1987. Pp. ix, 88. \$10.00, paper. ISBN 0-87078-213-4. JEL 87-0933

Examines the problems facing the civil service, including the difficulties of attracting and keeping competent administrators. Focuses on suggested reforms for strengthening and enhancing the Senior Executive Service (SES). Background paper by Mark Huddleston presents a comprehensive review of the development of the U.S. civil service and the SES describing the nature of the service,

examples of types of jobs included, career and non-career relationships, the rewards, and its relationship to governmental performance. Indicates that the SES is in trouble, since many of its members have left federal employment because of low pay and inadequate promotion experience. Recommends that recruiting personnel should begin at the entry level of civil service jobs to allow for advancement into an elite SES. Endorses higher pay for these officials with managerial salaries substantially above other civil servants. Includes dissents and supplementary statements. Huddleston is at the University of Delaware. No index.

ISE, DAVID A., ed. *Public sector payrolls*. National Bureau of Economic Research Project Report series. Chicago and London: University of Chicago Press, 1987. Pp. ix, 327. \$40.00. ISBN 0-226-90291-9. JEL 87-0934

Ten papers presented at a conference held in Williamsburg, Virginia, in November 1984. Topics include: military and civilian pay; the debt and structure of military pensions; military hiring and youth employment; military enlistments and the youth labor market; military service and civilian earnings of youth; wages in the federal and private sectors; the responsiveness of public sector wages and employment to economic conditions; the incentive structures of local public pension plans; comparable worth in the public sector; and evidence from the National Longitudinal Study of the high school class of 1972 on academic ability, earnings, and the decision to become a teacher. Also contains an overview by the editor. The contributors are economists. Wise is John F. Stambaugh Professor of Political Economy at the John F. Kennedy School of Government, Harvard University. Author and subject indexes.

### 830 TRADE UNIONS; COLLECTIVE BARGAINING; LABOR-MANAGEMENT RELATIONS

HOBADIAN, ABBY AND WHITE, MICHAEL. *Job evaluation and equal pay*. Department of Employment Research Paper series, no. 58. London: Policy Studies Institute, Department of Employment, 1986. Pp. 179. Paper. JEL 87-0935

Report of a study on job evaluation in Great Britain sponsored by the Department of Employment, London. Research included questionnaire interviews with managers responsible for evaluations as well as with employee representatives, sample data for male and female pay covered by the same job evaluation scheme, and miscellaneous

documents on the subject in 109 establishments. Describes the Equal Pay Act of 1970 and its Amendment in 1983. Discusses the background for job evaluation, job analysis, and administrative and operating arrangements. Finds that in general worker representatives approved of job evaluations and their implementation and administration and reaffirmed management's assertions that the procedure was a highly participative process. Ghobadian and White are staff members of the Department of Employment. No index.

JEFFERYS, STEVE. *Management and managed: Fifty years of crisis at Chrysler*. Cambridge: New York and Melbourne: Cambridge University Press, 1986. Pp. xiv, 290. \$29.95. ISBN 0-521-30441-5. JEL 87-0936

Focus is on workplace politics at Chrysler Corporation and its flagship Dodge main plant. Argues that the balance of power between management and the managed has been in contention throughout the last fifty years, challenging the view that the American labor movement is characterized by passivity. Addresses three key industrial relations issues: how management exerts its control over the labor process; how changes in management control are legitimized in workers' beliefs; and how particular traditions of workplace behavior and organization are created. Describes current theories of the development of the labor process and management control, emphasizing the development of the Union of Automobile Workers (UAW). Begins the story of Chrysler by showing how weak management and weak unionism produced a powerful shopfloor unionism. Traces the struggles over control by management and the union and how new challenges—such as the black movement—affected this balance. Relates many of the problems of open conflict to management failure under conditions of market pressure rather than to militancy of the labor force. Concludes that the organizational and economic weaknesses of Chrysler management compared to GM and Ford, rather than any generic peculiarities of Chrysler workers, led to its long record of bitter labor relations conflict. Jefferys is Senior Lecturer in the Economics and History Department at Manchester Polytechnic. Bibliography; index.

KUMAR, PRADEEP. *The current industrial relations scene in Canada, 1986*. With MARY LOU COATES AND DAVID ARROWSMITH. Kingston, Ontario: Queen's University, Industrial Relations Centre, 1986. Pp. xi, 358. \$100.00. ISBN 0-88886-140-0. JEL 87-0937

Annual volume that brings together a wide variety of recent reference material in industrial rela-

tions and provides an analysis of emerging issues. Divided into four parts: (1) a summary reviewing emerging industrial relations trends and patterns, covering topics such as the economic environment; the labor market environment; the public policy environment; the labor movement and trade unionism; the collective bargaining scene; and wages, productivity, and labor costs, including international comparisons; (2) reference tables that include technical notes and data sources supporting the topics treated in the summary; (3) a bibliography of information and data sources; and (4) abstracts from recent industrial relations literature. Kumar, Coates, and Arrowsmith are with the Industrial Relations Centre, Queen's University. Author index.

KUSACK, JAMES M. *Unions for academic library support staff: Impact on workers and the workplace*. New Directions in Information Management series, no. 10. New York and London: Greenwood Press, 1986. Pp. xi, 108. \$25.00. ISBN 0-313-24991-1. JEL 87-0938

Study of academic library support staff unions. Reviews the history of collective bargaining by support staff employees working in university libraries. Analyzes the effects of collective bargaining in different occupations with special reference to clerical and white collar employees. Discusses the implications of collective bargaining for compensation levels and potential shifts in productivity. Compares the compensation patterns, work policies, and other job-related characteristics of university libraries with support staff unions with those of libraries without such unions. Discovers no statistically significant differences in characteristics of libraries with and without support staff unionization. Evaluates current literature and provides suggestions for future research. Kusack is Assistant Professor at the School of Library Science and Instructional Technology at Southern Connecticut State University. Selected bibliography; index.

O'REILLY, JAMES T. *Unions' rights to company information*. Revised edition. With the assistance of JODI C. ARONSON. Labor Relations and Public Policy series, no. 21. Philadelphia: University of Pennsylvania, Wharton School, Industrial Research Unit, [1980] 1987. Pp. xiii, 312. Paper. ISBN 0-89546-060-2. JEL 87-0939

Revised, updated, and expanded version of a study that assesses the current status and effect of conflicting laws and regulations covering the right of individuals and organizations to obtain private information versus the right to maintain the privacy of such information. [For previous annotation see JEL no. 81-0236.] Reviews the nature of

disclosure. Discusses disclosure pursuant to the Taft-Hartley Act, focusing on the duty to disclose in the collective bargaining process, presumptively relevant data, in varying situations, the demonstration of relevance, financial disclosures and the employer's duty to substantiate, effects of the collective bargaining agreement on the duty to disclose, and employer defenses against the National Labor Relations Board. Examines the privacy issue including the employer-employee relationship and federal privacy legislation, and the privacy of employment and medical records. Discusses the Freedom of Information Act and the National Labor Relations Board as a source of safety and equality data. Concluding remarks examine the future prospects of information disputes and controversies. The author is a corporate attorney. Index of cases.

ROWAN, RICHARD L. AND BARR, ROBERT E. *Employee relations trends and practices in the textile industry*. Major Industrial Research Unit Studies series, no. 65. Philadelphia: University of Pennsylvania, Wharton School, Industrial Research Unit, 1987. Pp. xvii, 124. Paper. ISBN 0-89546-063-7. JEL 87-0940

Fourth contribution in the Wharton Industrial Research Unit pertaining to labor and personnel practices and policies in various industries in which unions are either losing ground or have failed to become a serious factor. Surveys employment trends, policies, and problems of the textile industry during the period 1981-85 in North Carolina, South Carolina, and Georgia. Includes discussion of wages, benefits, work scheduling, grievance procedures, and health and safety. Results are based primarily on data from surveys, questionnaires, and personal interviews, with a follow up study. Concludes that the future will witness more mergers, an increase in capital investment, and a decrease in numbers employed and efforts at unionization likely will be frustrated. Rowan is Co-director of the Industrial Research Unit, University of Pennsylvania. Barr is with a high technology firm in Massachusetts. Index.

#### 840 DEMOGRAPHIC ECONOMICS

DAVIS, KINGSLEY, ed. *Contemporary marriage: Comparative perspectives on a changing institution*. In association with AMYRA CROSSBARD-SHECHTMAN. New York: Russell Sage Foundation, 1985. Pp. xiii, 432. \$29.95. ISBN 0-87154-321-8. JEL 87-0941

Sixteen papers, many of which were first presented at a conference at the Center for Advanced

Study in the Behavioral Sciences at Stanford, California, in August 1982, examine the meaning and significance of marriage in contemporary society. Eleven papers document trends with respect to age at marriage, permanent celibacy, cohabitation, single parenthood, divorce, wives' employment, and fertility primarily in the United States but also in other countries (France, Israel, Japan, China, and Southern Africa) as well as in the Mormon society. Other papers analyze divorce law revolution, new legal models of marriage and divorce, marriage squeezes and the marriage market, and emotional aspects of contemporary relations. Contributors are mainly sociologists and anthropologists; two are economists. Davis is Distinguished Professor of Sociology at the University of Southern California. Grossbard-Shechtman is Associate Professor of Economics, San Diego State University. Index.

MENKEN, JANE, ed. *World population and U.S. policy: The choices ahead*. American Assembly, Columbia University, series. New York and London: Norton; Markham, Ontario: Penguin Books Canada, 1986. Pp. viii, 255. \$8.95, paper. ISBN 0-393-30399-3. JEL 87-0942

Seven papers originally presented as background papers for the Seventy-first American Assembly in Harriman, New York, in April 1986, as well as the final report of the Assembly and an introduction by the editor that considers issues related to the change in U.S. population policy in 1984 and the current debate about the relationship of population growth to economic development. Papers examine: world population history, trends, and projections (Paul Demeny); whether the economic consequences of population growth provide a sound basis for population policy (Samuel H. Preston); population trends and economic development (Ansley J. Coale); fertility change in the third world (John Bongaarts); family planning programs (George B. Simmons); immigration, immigration policy and demographic change in the United States (Michael S. Teitelbaum); and population policy choices available to the U.S. concerning rapid population growth in the third world (David E. Bell). The American Assembly's final report lists recommendations for U.S. foreign policy concerning population. Menken is Professor of Sociology and Public Affairs and Assistant Director of the Office of Population Research, Princeton University. Index.

NERLOVE, MARC; RAZIN, ASSAF AND SADKA, EPHRAIM. *Household and economy: Welfare economics of endogenous fertility*. Economic Theory, Econometrics, and Mathematical Economics series. Boston:

London; Sydney and Toronto: Harcourt, Brace, Jovanovich; Academic Press, 1987. Pp. xiii, 155. \$29.95. ISBN 0-12-515752-5. JEL 87-0943

Examines the general equilibrium implications of endogenous fertility for issues of population policy. Assumes that parents maximize their own utility functions in making decisions regarding the number of children and investments in them. Begins with a review of social welfare criteria for optimal population size and the static theory of optimal population size, optimal population growth with exogenous fertility, and the theory of endogenous fertility. Examines the basic principles of welfare economics and externalities; summarizes the traditional theory of household behavior and its modifications covering parental decisions regarding fertility and investments in children. Discusses optimal population size according to various social welfare criteria, from the perspectives of average and total utility. Analyzes potential and real market failures, with emphasis on the endogeneity of fertility, and examines alternative reasons for having children and the concept of children as a capital good. Describes the implications of endogenous fertility for intragenerational income distribution. Indicates future areas for research. Nerlove is a member of the Department of Economics at the University of Pennsylvania. Razin and Sadka are both members of the Department of Economics at Tel-Aviv University. Author and subject indexes.

UNITED NATIONS DEPARTMENT OF INTERNATIONAL ECONOMIC AND SOCIAL AFFAIRS. *World population prospects: Estimates and projections as assessed in 1984*. Population Studies series, no. 98. U.N. Publication Sales No. E.86.XIII.3. New York: Author, 1986. Pp. x, 330. \$35.00, paper. ISBN 92-1-151159-3. JEL 87-0944

Provides updated and comparable estimates and projections of population and related major demographic variables for countries as well as areas and regions of the world. Supersedes the 1982 assessment. Presents indicators relating to size, age and sex structure, population composition, growth, fertility, mortality, urbanization, and international migration in intervals of five years for the period from 1950 to 2025. Introductory chapters discuss methods, data, assumptions, and major findings. The publication mainly consists of statistical tables. Magnetic tape and French, Russian, and Spanish editions available. No index.

WORLD BANK; POPULATION, HEALTH, AND NUTRITION DEPARTMENT; POLICY AND RESEARCH DIVISION. *Population growth and policies in sub-Saharan Africa*. Washington, D.C.: Author, 1986. Pp. x, 102. Paper. ISBN 0-8213-0773-8. JEL 87-0945

Focuses on the economic consequences of rapid population growth in Africa and on policies and programs to reduce population growth. Describes Africa's current demographic situation and presents projections for demographic change up to the year 2050. Assesses the consequences of individual decisions by African parents to have many children. Discusses measures that strengthen the demand for smaller families and build a consensus about the legitimacy of family planning. Describes the current state of family planning programs in sub-Saharan African countries and considers steps to ensure rapid program expansion. Examines the question of what role the government should play in developing programs and extending services and sources of population assistance. Prepared by the staff of the Policy and Research Division of the Population, Health, and Nutrition Department, World Bank. No index.

#### 850 HUMAN CAPITAL; VALUE OF HUMAN LIFE

MIKKELSEN, BRITHA. *Formation of an industrial labour force in Kenya: Experiences of labour training in the metal manufacturing industries*. CDR Research Report series, no. 10. Copenhagen: Centre for Development Research, 1986. Pp. 137. Dkr 20.00, paper. ISBN 87-88467-32-5.

JEL 87-0946

Examines the development of Kenya's labor force as a human resource in the 1970s through 1981. Surveys the work and training conditions of manual workers in a sample of production and maintenance companies in the metal trades and worker experiences and company and government training policies and practices. Analyzes the structure of training for the industrial labor market and uses company profiles to study workmanship in the engineering trades. Mikkelsen is a researcher with the Centre for Development Research, Copenhagen. No index.

#### 900 Welfare Programs; Consumer Economics; Urban and Regional Economics

##### 910 WELFARE, HEALTH, AND EDUCATION

ANDERSON, DOLE A. *Management education in developing countries: The Brazilian experience*. Latin American Monograph Series, vol. 20. Boulder, Colo. and London: Westview Press in cooperation with the Latin American Studies Center, Michigan

State University, 1987. Pp. 205. \$23.50, paper. ISBN 0-8133-7347-6.

JEL 87-0947

Presents results of field work begun in 1981, examining the literature and interviewing individuals involved in the development and current operation of Brazilian schools of administration, replicating the Ford and Carnegie Foundation reports of 1959. Information summarizes results of visits to seven schools and three research institutes in five cities and interviews with seventy-eight educators, government officials, and business executives. Specific attention is given to: (1) management and management education worldwide, emphasizing the management education boom and the Foundation reports; (2) business as an occupation in Brazil, with some sketches of the business elite; (3) Brazilian higher education; (4) management schools and their programs; (5) management students, including their aspirations and achievements and what the graduates do; and (6) faculty and research. The concluding chapter deals with building quality for the future, focusing on the linkage with the business community and role of the government. Anderson is Emeritus Professor in the Graduate School of Business Administration, Michigan State University. Glossary of acronyms; bibliography; index.

BRODY, MICHAEL. *Immunization. dice*. Twentieth Century Fund Paper series. New York: Priority Press, 1987. Pp. vi, 77. Paper. ISBN 0-87078-211-8.

JEL 87-0948

Discusses ways to insure vaccine manufacturers against law suits that hold them liable under the "deep pockets" theory, which believes that nobody pays when insurance companies or large corporations must provide compensation to innocent victims. Analyzes the various remedies proposed to handle the vaccine problem—the concern that unless vaccine manufacturers can be protected against unlimited damages awards, new vaccines needed to battle diseases such as AIDS or herpes will not be marketed. Finds that many insurers now are refusing to underwrite these risks because they are unable to determine the degree of certainty of potentially large damage awards. Reviews the nature of the crisis, especially for the development of future vaccines. Associates the revolution in medical research with aggravating the crisis. Discusses the obstacles in finding control groups on which to test new vaccines. Describes the economics of law suits and torts, pointing out the risk in marketing a vaccine that could benefit millions, but might also give a handful the subject disease. Examines the pros and cons of a no-fault insurance approach. Concludes that any new system must guarantee medical care and adequate compensa-

tion for victims at the same time that it provides for predictable costs for insurers. Brody is a journalist for *Fortune*. No index.

BROOKS, RICHARD G. *The development and construction of health status measures: An overview of the literature*. IHE Report series, 1986:4. Lund, Sweden: Swedish Institute for Health Economics, 1986. Pp. 107. Paper. ISSN 0349-7631.

JEL 87-0949

Part of a series of publications that provide the results of a research program concerning health status measures and the interrelationships between such measures and economic analysis. Presents the background to the development of these measures. Notes importance of health status measures to appraise the effectiveness of medical interventions, to examine the possibilities of improving clinical observations, and to assess the quality of care. Following comments on the analytical framework, the report considers the definition of health and the methodological criteria required in health status index development. Reviews how well various indices meet these criteria. Also discusses measures of quality of care assessments, treating structure, process, and outcome. Presents an outline of health indices, classified as functional assessment, global/multiattribute, mental health status, quality of life, and "other." Reviews positions of other writers on health status measures. Concludes that indices should be concise, easy to use, capable of self-administration, and useful for purpose of evaluation and determination of public policy. Brooks is Lecturer in Economics at the University at Strathclyde, Glasgow. Bibliography; no index.

BURTLESS, GARY, ed. *Work, health, and income among the elderly*. Studies in Social Economics series. Washington, D.C.: Brookings Institution, 1987. Pp. xiii, 276. \$26.95. ISBN 0-8157-1176-0.

JEL 87-0950

Six papers address a variety of policy issues relating to the work and health status of the aged and to the adequacy of income and food consumption among households headed by older persons. James M. Poterba and Lawrence H. Summers discuss public policy implications of declining old-age mortality. Martin Neil Baily focuses on policy issues and recent trends in connection with aging and the ability to work. Gary Burtless examines the effect of education, earnings, and occupational attachment on the health status and work capacity of American men aged 58 to 73. Jerry A. Hausman and Lynn Paquette discuss involuntary early retirement and food consumption. Robert A. Moffitt analyzes whether more generous social security benefits have led to early retirements. Alan J. Auerbach

and Laurence J. Kotlikoff discuss the adequacy and determinants of life insurance for those aged 58 to 65. Burtless is a Senior Fellow in the Brookings Economics Studies Program. Index.

GREENBERG, DAVID AND WOLF, DOUGLAS. *Using computers to combat welfare fraud: The operation and effectiveness of wage matching*. With JENNIFER PFIESTER. Studies in Social Welfare Policies and Programs series, no. 2. New York and London: Greenwood Press, 1986. Pp. xiv, 265. \$37.95. ISBN 0-313-24870-2.

JEL 87-0951

Analysis of the use of computer-aided wage matching systems to verify earnings reported by recipients in the Food Stamp and Aid to Families with Dependent Children (AFDC) Programs. Part 1 reviews the background to and methodology of wage matching systems and their development and use as an administrative tool. Part 2 describes wage matching systems, discussing system elements, the actual performance of matches, and follow-up activities. Part 3 presents the framework for cost-benefit analysis of wage-matching systems and compares the methods employed in New Jersey; San Joaquin County, California; and New Hampshire. Part 4 presents a summary of findings and recommendations for improvement of fraud detection. Greenberg is Professor of Economics at the University of Maryland. Wolf is Senior Research Associate at the International Institute for Applied Systems Analysis, Luxenburg, Austria. Bibliography; index.

JIMENEZ, EMMANUEL. *Pricing policy in the social sectors: Cost recovery for education and health in developing countries*. Baltimore and London: Johns Hopkins University Press for the World Bank, 1987. Pp. vi, 170. \$16.50. ISBN 0-8018-3501-1.

JEL 87-0952

Reviews recent research on the desirability of increasing the role of prices in financing and allocating educational and health services in developing countries. Describes current pricing policy in LDCs and its effect on efficiency and equity, and then shows how both can be improved by adjusting cost recovery policies. Argues that blanket policies of free facilities have led to both inefficiency and inequity. Documents the financial crisis confronting the social sectors, pinpointing the effects of budgetary constraints, excess demand for social services, and lack of flexibility. Reviews practices that support inequity in the current system. Proposes changing pricing policy to include pricing for efficient provision of these services, using the basic principles of microeconomics (particularly marginal analysis) and emphasizing economies of scale, costs, and behavioral parameters. Considers

pros and cons of user fees. Jimenez is with the World Bank. Index.

KOP, YAAKOV, ed. *Changing social policy: Israel, 1985-86*. Jerusalem: Center for Social Policy Studies in Israel, 1986. Pp. xxiii, 259. Paper.

JEL 87-0853

This report presents data on macro-allocations for Israel's human services, describing the nation's commitments and priorities in shaping its socioeconomic policies. Examines and analyzes the allocation of resources for the social services, embracing education, health, income maintenance, personal welfare services, employment, housing, immigrant absorption, and social aspects of tax policy. Divided into three parts. Part 1 summarizes the trends in social expenditure and its distribution. Separate chapters are devoted to education, health, income maintenance, and personal welfare. Part 2 discusses the implications of resource allocation policy from the point of view of the government sector and the entire economy. Also discusses the propriety of income maintenance programs and "package deals"—wage, price, and policy arrangements between the government, labor, and employers. The third part discusses tax policy, tax relief under the law, and housing assistance policy. Kop is Director of Research, Center for Social Policy Studies in Israel. No index.

VON DER SCHULENBURG, J.-MATTHIAS GRAF, ed. *Essays in social security economics: Selected papers of a conference of the International Institute of Management, Wissenschaftszentrum, Berlin*. Microeconomics Studies series. New York; Berlin; London and Tokyo: Springer, 1986. Pp. ix, 222. \$34.10. ISBN 0-387-16743-9. JEL 87-0954

Nine essays presented at the Workshop on the Origin and Future of Social Security Schemes at the International Institute of Management at the Science Centre, Berlin, December 1984. Focuses on current issues in social security policy, such as the economic effects of demographic changes, equal pension rights for women, and reform proposals for social health insurance. Papers examine the influence of political institutions on social security policies from a public choice perspective; public pensions and political decision making; intergenerational solutions to the social security dilemma; social security and intergenerational equity; intergenerational equity and fund balances for statutory health insurance; improvements in state pension rights for women; statutory health insurance and its reform, presenting a review of the bonus system as an innovation in health insurance in West Germany; and the determinants of the use of physician services under statutory health

insurance, also in West Germany. Von der Schulenburg is with Wissenschaftszentrum Berlin. Author and subject indexes.

VON DER SCHULENBURG, J.-MATTHIAS GRAF AND SKOGH, GÖRAN, eds. *Law and economics and the economics of legal regulation*. International Studies in Economics and Econometrics series, vol. 13. Hingham, Mass.; Dordrecht and Lancaster: Kluwer Academic, 1986. Pp. x, 230. \$61.00. ISBN 90-247-3377-4. JEL 87-0955

Eleven papers selected from a conference in June 1985 at the International Institute of Management of the Wissenschaftszentrum Berlin on "Law and Economics of Legal Regulation." Focus is on the way in which law determines the use of scarce resources and the way in which scarce resources influence the legal structure. Part 1 is an introduction. Part 2 discusses law and economics. The first essay considers questions dealing with the inalienability of property rights, developing a classification of entitlements illuminating property relationships in modern welfare states. The next contribution analyzes the negotiation process as an elaborate bargaining game in which threat plays an important role. This is followed by a critical survey of economic efficiency and the common law. The last two essays in this part examine default risks and the optimal pricing of court enforcement services and present a theory relating transactions costs to communication. Part 3 deals with the economics of legal regulation, including discussions of regulatory measures to enforce quality production among self-employed professionals, controlling insider trading in Europe and America, the regulation of shop opening hours in the United Kingdom, Belgian public policy toward retailing, and assessing the effectiveness of economic efficiency of an EEC pollution control directive to reduce discharges of mercury to the environment. Contributors are economists and lawyers. Von der Schulenburg is with Wissenschaftszentrum Berlin. Skogh is with the University of Lund. Index.

UNITED NATIONS DEPARTMENT OF INTERNATIONAL ECONOMIC AND SOCIAL AFFAIRS, STATISTICAL OFFICE. *Concepts and methods for integrating social and economic statistics on health, education and housing: A technical report*. Studies in Methods, Series F, no. 40. U.N. Publication Sales No. E.86.XVII.23. New York: United Nations, 1986. Pp. viii, 67. \$8.50, paper. ISBN 92-1-161875-6. JEL 87-0856

Assesses the state-of-the-art of the development of integrated social and economic statistics. Considers general issues in integration, the importance of multi-purpose classifications (especially accord-

ing to socioeconomic group), problems and possibilities for linkages between micro- and macro-data, and technical issues involved in the use of economic statistics and statistical systems in social fields related to economic measurement and the use of national accounts. Analyzes practical problems of integration in the areas of health services, educational services, and housing and human settlements. Contains suggestions for improving the collection, processing, and presentation of social and economic statistics for national and international socioeconomic policy planning, monitoring, and analysis. Prepared by Christopher Saunders as consultant to the U.N. Secretariat. Also available in French, Russian, and Spanish. No index.

UPHAM, FRANK K. *Law and social change in postwar Japan*. Cambridge, Mass. and London: Harvard University Press, 1987. Pp. x, 269. \$25.00. ISBN 0-674-51786-5. JEL 87-0957

Examines law and social change in contemporary Japan, especially the way in which elites use legal rules and institutions to manage and direct conflict and control change at a social level. Refutes the view that Japan is characterized by a social life virtually free of conflict, a low rate of litigation, a small number of lawyers, and the settlement of most disputes by mediation and arbitration. Presents four case studies to investigate how law affects the course of social conflict: the evolution of the antipollution movement; the struggle to overcome social discrimination; the elimination of sex discrimination; and the formation of industrial policy by the Ministry of International Trade and Industry. Examines the options of aggrieved persons in each case. Concludes that law can play the same instrumental role in the pursuit of private interests and social goals in Japan that it plays in other countries. Upham is Associate Professor at the Boston College Law School. Index.

U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES, HEALTH CARE FINANCING ADMINISTRATION, OFFICE OF RESEARCH AND DEMONSTRATIONS. *Health care financing: Program statistics. Medicare and Medicaid data book, 1984*. HCFA Pub. No. 03210. Baltimore, Md.: Author; distributed by U.S.G.P.O., 1986. Pp. vii, 135. \$6.50, paper. JEL 87-0958

Third in a series of descriptive statistical reports on the Medicare and Medicaid programs. Focuses on calendar year 1981 for Medicare and fiscal years 1981 and 1982 for Medicaid. Provides information on the relationships between the two programs, federal administration of the programs, and comparative program expenditures. Presents data on number of enrollees and recipients of benefits, total outlays, and services. Reviews the major charac-

teristics of Medicare and Medicaid including eligibility, benefits, financing, and administration. Discusses prepaid health plans and the Medicare statistical system. Examines the *National Medical Care Utilization and Expenditure Survey* and the Medicaid data system. Glossary; no index.

WIENER, JOSHUA M., ed. *Swing beds: Assessing flexible health care in rural communities*. Brookings Dialogues on Public Policy series. Washington, D.C.: Brookings Institution, 1987. Pp. ix, 140. \$11.95, paper. ISBN 0-8157-9283-2. JEL 87-0959

Seven papers, several with comments, presented at a conference at the Brookings Institution in February 1986. Describes the "swing-bed" concept as a means to allow small rural hospitals with fewer than fifty beds to use them interchangeably for either acute or home care, with reimbursement adjusted accordingly. Two papers present a framework for examining swing beds and summarize the experience of the Robert Wood Johnson Foundation demonstration, cosponsored by the American Hospital Association, and designed to help hospitals and hospital associations implement the swing bed concept. A third paper examines economic and financial issues and analyzes the circumstances under which swing beds are cost effective. Another contributor describes several options for reform of the reimbursement systems. Two papers review the practice from the patient's perspective with respect to access and the quality of care. The final paper evaluates the program and presents implications for the future. The contributors are Anthony R. Kovner, Hila Richardson, Steven A. Finkler, John Holahan, Peter W. Shaughnessy, Helen L. Smits, Bruce C. Vladeck, and the editor, who is Senior Fellow at the Brookings Institution. No index.

WORLD BANK. *Brazil: Finance of primary education*. World Bank Country Study series. Washington, D.C.: Author, 1986. Pp. 78. \$5.00, paper. ISBN 0-8213-0843-2. JEL 87-0960

Studies the educational finance sector in Brazil, with emphasis on primary education. Useful as a background for the debate on constitutional reform and decentralization of financing and providing education. Defines problems of inequity and inefficiency, noting an inequitable allocation of resources for education and an inefficient use of allocated resources. Finds inequities among income groups, regions, and urban and rural areas. Documents the inefficiencies of the system of intergovernmental education transfers. Identifies five policy issues: lack of policy analysis and planning at the federal budget level; inequities across education sectors

with larger subsidies in higher education at the expense of low quality primary education; regional inequities; ineffective use of resources; and inefficient transfer of funds to state and municipal schools. Recommends policies to improve federal administration, lessen inequities through a cost recovery program and higher admission standards for advanced education, and efforts to lessen the repetition rate for first graders. Finds that compared to countries of similar income levels, Brazil has not given high priority to investment in education. Glossary; no index.

**WORLD BANK.** *China: Management and finance of higher education.* World Bank Country Study series. Washington, D.C.: Author, 1986. Pp. viii, 126. \$9.00, paper. ISBN 0-8213-0842-4.

JEL 87-0961

Prepared on the basis of a mission that visited China in 1985. Looks at key issues for China in the management and finance of higher education over the next fifteen years and at policy options in view of recent Chinese proposals for reforms in education and international experiences. Presents: a review of the government's plan for long-term expansion of higher education; estimates of demand for and supply of high-level manpower in view of Chinese structural changes and growth to the year 2000; analysis of the cost structure of universities; an assessment of practices in maintenance and management of facilities; an evaluation of university accounting and finance practices; and an examination of the feasibility of higher education plans. Concludes that China should adopt a medium growth-scenario for universities, especially since there are other pressing claims for resources for education, recognizing that there is a trade off in the demands for these funds. No index.

### 930 URBAN ECONOMICS

**HARDY, JORGE E. AND SATTERTHWAITE, DAVID, eds.** *Small and intermediate urban centres: Their role in regional and national development in the third world.* Boulder, Colo.: Westview Press in association with the United Nations University, 1986. Pp. xx, 421. \$37.50, paper. ISBN 0-8133-0404-0.

JEL 87-0962

Nine articles summarize the findings and present conclusions from the first phase of a collaborative

research program on the present and potential role of small and intermediate urban centers in the development process. Two objectives are indicated: to provide a better understanding of how social, economic, and political forces shape urban systems over time and their impact on economic development and to understand the rationale of the cost/benefits of government intervention to stimulate development, with most of the attention on the first aim. Six papers present case studies of the Upper Valley of Rio Negro and the Comahue Region in Argentina, the Gezira Region in The Sudan, selected areas in South India, several centers in North India, and Southwest Nigeria. The articles that follow survey factors affecting development in these types of centers and government policies affecting them, and also draw conclusions about the roles the centers should play in social and economic development programs. Contributors are mainly geographers and social scientists specializing in urban and regional studies. Hardy is Senior Fellow, Centro de Estudios Urbanos y Regionales, Buenos Aires. Satterthwaite is a researcher with the Human Settlements Programme, International Institute for Environment and Development. Annotated bibliographies; index.

**McKEOWN, KIERAN.** *Marxist political economy and Marxist urban sociology: A review and elaboration of recent developments.* New York: St. Martin's Press, 1987. Pp. xviii, 282. \$32.50. ISBN 0-312-51794-7.

JEL 87-0963

Centers on Marxist urban sociology, analyzing some of the key issues within the Marxian framework and the relevance of that framework to the analysis of urban areas. Part 1 provides an overview of Marxian political economy, analyzing Marx's theories of value, crisis, rent, and productive and unproductive labor. Part 2 examines the works of French urban sociologists Manuel Castells and Jean Lojkin by reviewing and outlining their conceptual frameworks and then evaluating their empirical research. Part 3 presents an alternative approach to Marxist urban sociology that incorporates a more micro-level analysis of urban processes and conflicts. McKeown is with the Social Research Centre at the National Institute for Higher Education at Limerick, Ireland. Bibliography; name and subject indexes.

### 940 REGIONAL ECONOMICS

**BATEY, P. W. AND MADDEN, M., eds.** *Integrated analysis of regional systems.* London Papers in Regional Science series, no. 15. London: Pion; distributed in the U.S. by Methuen, N.Y., 1986. Pp.

222. \$21.50, paper. ISBN 0-85066-116-0.

JEL 87-0964

Twelve papers, nine presented at the 1984 Annual Conference of the Regional Science Association, British Section at the University of Kent at Canterbury. Focus is on developments in research related to three facets of integration, i.e., regional activity, interregional linkages, and conjoining different types of regional models. Papers discuss: methodological problems in the design of regional models (integrated forecasting models; consistent modeling of employment, population, labor force, and unemployment; general problems of integration; and complexity and the effects of transit on urban forms); models from the social accounts/input-output tradition (a model of two populations and their economies; biregional analysis using a social accounts matrix); a regional input-output analysis of the economic consequences of a change in demographic patterns; an input-output/vacancy chain approach to the regional impact of migrants' expenditure; and policy applications (review of socioeconomic impact-assessment models, analysis of the socioeconomic impacts of a regional synthetic fuels industry, state and local fiscal analysis, and applications of biregional input-output in regional policy analysis). The authors are members of the Department of Civic Design, University of Liverpool. Subject and author indexes.

NIJKAMP, PETER, ed. *Handbook of regional and urban economics*. Volume 1. *Regional economics*. Handbooks in Economics series, no. 7. Amsterdam; New York; Oxford and Tokyo: North-Holland; distributed in the U.S. and Canada by Elsevier Science, N.Y., 1986. Pp. xxii, 702. \$65.00. ISBN 0-444-87969-2.

JEL 87-0965

Sixteen papers on fields of regional economics collected to represent a source, reference, and teaching supplement for use by professional researchers and advanced graduate students. Provides surveys of the current state of regional economics. General areas and specific topics covered are: locational analysis (location of production activities, residential mobility and household location, public facility location, spatial equilibrium analysis, and regional economic dynamics); regional economic models and methods (regional and multiregional models, regional input-output analysis, spatial interaction models, regional econometric and dynamic models, and qualitative statistical models); and regional economic development and policy analysis (multiple objective decision analysis, regional labor market analysis, regional energy and environmental analysis, innovation and changes in regional structure, and regional policies in developing countries). Nijkamp is a member of the De-

partment of Economics at the Free University, Amsterdam. Author and subject indexes.

#### Related Disciplines

ABEL, CHRISTOPHER AND TORRENTS, NISSA, eds. *Martí, José: Revolutionary democrat*. Durham, N.C.: Duke University Press, 1986. Pp. xviii, 238. \$29.95. ISBN 0-8223-0679-4.

JEL 87-0966

Nine papers discuss various aspects of the career of José Martí, a Cuban nationalist and revolutionary, who lived from 1853 to 1895. Papers by Ivan M. Schulman and Roberto Fernández Retamar analyze Martí's modernity. Papers by Gerald E. Poyo and Jacqueline Kaye examine Martí's role among émigré communities in the United States and his writings in and about the U.S. Antoni Kapcia discusses Cuban populism; Jorge Ibarra examines Martí's ideology in its relationship to socialism; and Christopher Abel assesses Martí in the context of the changes in the international order during the last decades of the nineteenth century. John M. Kirk examines Martí's intellectual commitment and Nissa Torrents analyzes his only novel *Amistad funesta*. The contributors are mainly specialists in Latin American history and languages. Abel is Lecturer in Latin American history, and Torrents is Lecturer in Latin American film and literature, both at University College, London. Bibliography; index.

EPSTEIN, JOSHUA M. *Strategy and force planning: The case of the Persian Gulf*. Washington, D.C.: Brookings Institution, 1987. Pp. xiii, 169. \$28.95, cloth; \$10.95, paper. ISBN 0-8157-2454-3.

JEL 87-0967

Sets forth three basic strategies available to the United States for the deterrence of Soviet conventional aggression and determines which of these would prove most credible in the Persian Gulf. Aim is to address a defense problem of immediate concern to the United States from the perspective of two questions: the most credible defense strategy and the force structure necessary to execute that strategy. Points to significant events that determine U.S. strategy in the Persian Gulf area, such as the collapse of the shah, the Iranian revolution, and the Soviet invasion of Afghanistan. Classifies strategies as symmetrical where the response is directed at the same location and time as the provocation and asymmetrical where the response is selected because it suits better against the adversary. Identifies three strategies and evaluates each: (1) vertical escalation where a small conventional force is dispatched as a tripwire that could be followed by nuclear employment; (2) horizontal escalation

lation, launching conventional counteroffenses; and (3) conventional defense. Argues that, contrary to the pessimism expressed about it, the asymmetrical strategy response is feasible. Epstein is a research associate in the Brookings Foreign Policy Studies program. Appendices present force structures and logistic requirements. Bibliography; index.

MCCGWIRE, MICHAEL. *Military objectives in Soviet foreign policy*. Washington, D.C.: Brookings Institution, 1987. Pp. xiv, 530. \$39.95, cloth; \$18.95, paper. ISBN 0-8157-5552-X. JEL 87-0968

Identifies Soviet strategic objectives in a world war and assesses how these objectives shape Soviet military requirements and the effect they have on Soviet foreign policy. Examines Soviet military policy in the twenty-five years following World War II; hypothetically outlines the Soviet plan of military operations for the contingency of world war; and discusses how planning for this contingency shapes Soviet policy, while producing a military posture and structure of forces that appear to the West as being far in excess of any legitimate defense needs. Argues that by assuming that escalation to an intercontinental exchange was not inevitable the Soviets could adopt the objective of avoiding the nuclear devastation of Russia and that this change in hierarchy of objectives explains more recent developments in Soviet Defense and foreign policies. Also argues that this change has generally favorable implications for peaceful coexistence. A general conclusion is that ill-founded, worst-case assumptions about the Soviet Union's broader intentions generate U.S. policies with results that are the opposite of what the United States desires. McGwire is Senior Fellow, Brookings Foreign Policy Studies Program. Index.

WEBBER, G. C. *The ideology of the British right 1918-1939*. New York: St. Martin's Press, 1986. Pp. 185. \$35.00. ISBN 0-312-00078-6.

JEL 87-0969

Examines the ideas of dissident conservatives and of fascists in Britain between the wars. Analyzes beliefs that the right wing held and argues that the variety of their ideas contributed to the weakness of the fascist movement in Britain by creating ideological barriers that limited the support it received from disillusioned conservatives. Considers the relationship between the right wing and the leadership of the Conservative Party and argues that ideology played an important part in the struggle between them. Discusses the importance of the right wing within the Conservative Party and examines perceptions of the social order, attitudes toward property and the economy, ideas

about the state, and problems of international relations. Focuses on ways in which the beliefs of the conservative right related to support for fascism in Britain and how the right wing of the Conservative Party itself changed from 1918 to 1939. A general conclusion is that prior to the 1930s the identity of the right was related to shared anxieties about imperial decline; however, during the 1930s the pattern of right-wing politics came to be dictated by economic rather than nationalistic issues. Webber is an administrator at the University of Newcastle-upon-Tyne. Bibliography; index.

#### NEW JOURNALS

##### ATAS Bulletin

The ATAS (*Advanced Technology Alert System*) Bulletin is a semiannual publication of the Centre for Science and Technology for Development, United Nations Secretariat, New York. The theme of the June 1986 issue (no. 3) is new information technologies and development, which emphasizes bridging innovations in information technology with efforts designed to integrate them into the development planning process. The issue contains forty articles (half of which are excerpted from previous works published around the world) organized into sections on technology (eight articles), experiences with technology (fourteen articles), implications (seven articles), capacity building (five articles), and policy options (six articles). Each section is preceded by a summary statement. Also contains an overview, concluding notes, glossary, and a listing of sources for further information. Available in French, Russian, and Spanish. Single issue: \$9.00. Write to: United Nations Publications, Room DC2-0853, New York, NY 10017. (ISSN 0257-5973)

##### Indian Journal of Industrial Relations

Quarterly publication of the Shri Ram Centre for Industrial Relations and Human Resources is devoted to the dissemination of knowledge in these fields; focuses on India. The January 1987 issue (Vol. 22, no. 3) has three articles, five shorter communications, and three book reviews. Topics of articles are: unemployment and casual labor in India, the Indian experience with industrial democracy, and employment growth in Indian industry. Communications discuss: industrial structure and the pattern of development in India, the relationship of job involvement to employees' morale and ambiguity-tolerance, motivation and entrepreneurial behavior of farmers, the relationship between workers' output and supervisory style and situation favorableness, and farm size and union density in Singapore. Also contains an international index of recently published journal articles about industrial

relations. Annual subscription: Rs. 80 in India; \$44.00, other countries, air mail; and \$20.00, other countries, sea mail. Single copy: Rs. 20, \$11.00, and \$5.00 respectively. Write to: K.K. Bhargava, Administrative Officer, Shri Ram Centre for Industrial Relations and Human Resources, 5-Sadhu Vaswani Marg, New Delhi 10005, India.

#### *Journal of International Economic Integration*

Biannual (spring and autumn) publication of the Institute for International Economics, King Sejong University, Seoul. Supports and encourages theoretical and empirical research in the areas of international trade and finance, international economic affairs, and international economic cooperation. The Autumn 1986 issue (Vol. 1, no. 2) contains nine articles. Their topics are: the current exchange rate system; migration abroad for temporary employment and the effects on the country of origin; multilateral productivity comparisons of selected Asian developing countries; non-traded goods in an asymmetric trade model; adjustment dynamics under dual exchange rates; empirical results of an exchange rate determination by the portfolio approach in South Korea; the changing pattern of South Korean comparative advantage from 1965 to 1980; product market imperfections and customs unions theory; and monetary policy devaluation and capital accumulation in an open developing economy with fixed exchange rates. Annual subscription: \$20.00, individuals and \$30.00, institutions; additional \$5.00 for air delivery. Write to: Institute for International Economics, King Sejong University, Seongdong-Ku, Seoul, South Korea 133.

#### *Journal of Real Estate Research*

Official publication of the American Real Estate Society; presents original scholarly research articles in the applied areas of real estate finance, investment analysis and decision making, valuation and real estate market analysis, and related areas. Focus is on articles that present a micro-oriented view. The Fall 1986 issue (Vol. 1, no. 1) contains seven articles; their topics are: inconsistencies in appraisal theory and practice; the use of rank transformation and multiple regression analysis in estimating residential property values with a small sample; analysis of recent rates of return and examination of the secondary market for public real estate limited partnerships; intercity differences in home price appreciation; the financial performance of real estate investment trusts; a survey of real estate investment acquisition rules for REITs; and a note on leading indicators of housing market price trends. Annual subscription and dues: academic, \$40.00; professional, \$40.00; institutional, \$125.00;

sponsor, \$1000.00; student, \$20.00; foreign, \$50.00. Write to: James L. Kuhle, Secretary/Treasurer ARES, College of Business, California State University, Sacramento, CA 95819.

#### *Natural Resource Modeling*

Published quarterly by the Rocky Mountain Mathematics Consortium. The major theme of the journal is the development and analysis of mathematical models as tools for resource management and policy development; publishes both primary research and expository survey articles on research modeling areas. The Fall 1986 issue (Vol. 1, no. 1) contains an article on search theory in natural resource modeling and a survey of optimal harvesting models in forestry management. Topics of the other six articles include: relationships between natural and harvest mortalities of the mallard, environmental damages and option values, neoclassical foundations of nonmarket benefits estimation, and regulation of targeting behavior in a multispecies fishery. Also contains book reviews and a calendar of events. Annual subscription: \$190.00. Write to: Rocky Mountain Mathematics Consortium, Arizona State University, Tempe, AZ 85287. (ISSN 0890-8575)

#### *New Zealand Economic Papers*

Published annually by the New Zealand Association of Economists, Inc. Main emphasis is on aspects of economics and economic history relevant to New Zealand. The 1986 issue (Vol. 20) contains ten articles whose topics are: compensation for Maori land rights, the political economy of W. B. Sutch, a search for policy objectives at the 1984 Economic Summit Conference, nonmarket valuation in New Zealand, a risk appraisal of New Zealand's export industries using asset pricing models, the extent and nature of diversification in New Zealand manufacturing industries, the impact of variation in share market and/or business conditions on the parameters of the market model, data preparation and use in implementable computable general equilibrium models, the New Zealand experience with balance-of-payments constraints and feasible growth rates, and question of whether or not New Zealand has a balance of payments problem. Also contains book reviews and listings of new books received and New Zealand discussion/working papers, 1985-86. Annual subscription: sent to all members, nonmembers, \$25.00 per copy plus postage. Write to: Business Manager, New Zealand Economic Papers, P.O. Box 568, Wellington, New Zealand.

#### *RIS Digest*

Quarterly bulletin of the Research and Information System for the Non-aligned and Other Devel-

oping Countries. The July 1986 bulletin presents a short article on current RIS activities, an article paying tribute to the life and work of Paul Prebisch, and three notes on the nonaligned summits I-VIII, the Southern African Development Coordination Conference, and the first round of Global System of Trade Preferences negotiations. An events section reviews the Tokyo Summit and the RIS Forum section contains brief articles pertaining to the Africa's debt crisis, international financial markets and developing countries, and the recent economic development of Romania. Also contains book reviews; information about RIS seminars, workshops, discussion and committee meetings; the RIS network; and publications. Write to: Dr. V. R. Panchamukhi, Director, Research and Information System for the Non-aligned and Other Developing Countries, 40-B Lodhi Estate, New Delhi 110-003, India.

#### *Urban Resources*

Published three times a year by Metropolitan Services, Division of Continuing Education, University of Cincinnati. An interdisciplinary journal

containing articles that apply academic research and practical experience to the problem-solving process involved in the study of urban affairs. The theme of the Fall 1985 issue (Vol. 3, no. 1) is technology and the future of cities. The issue contains eight articles, three book reviews, local interest updates on activities related to the theme in eleven U.S. cities, and a bibliography. Topics of the articles are: technology and human values; information technology and urban revitalization; contrasting historical patterns of ownership and regulation of water, electricity, and cable television; new technology for infrastructure renewal; a high-tech toxics guide for local communities; cooperative research in manufacturing; the information revolution in Toronto; and the urbanization of electric and gas systems from 1880 to 1930. Subscription: individuals, \$15.00 for one year, \$25.00 for two years, or \$25.00 and \$48.00 for master edition; institutions, \$20.00 for one year, \$35.00 for two years, or \$35.00 and \$68.00 for master edition. Write to: *Urban Resources*, Metropolitan Services, University of Cincinnati, Mail Location #175, Cincinnati, OH 45221.

#### Editor's Note

The following persons assisted the editors in annotating these books: Mrs. Joan Daley, and Dr. Vibha Kapuria-Foreman and Professor Reuben E. Slesinger (both of the University of Pittsburgh).

The articles appearing in the Subject Index were classified under the direction of Professor Asatoshi Maeshiro, Editorial Consultant, assisted by Mr. A'Amer Farooqi, Mr. Nayyer Hussain, Mr. Edgar L. Zamalloa, and Mrs. Lorena M. Zamalloa (all of the University of Pittsburgh).

# Contents of Current Periodicals

Abstracts of articles marked thus ● appear in this issue. See the *Index of Authors of Articles in the Subject Index* for page numbers, in *italics*.

## 600 Industrial Organization; Technological Change; Industry Studies

1586 1604

### 610 Industrial Organization and Public Policy

1586 1604

611 Market structure: industrial organization and corporate strategy

612 Public policy toward monopoly and competition

613 Regulation of public utilities

614 Public enterprises

615 Economics of transportation

616 Industrial policy

619 Economics of regulation

### 620 Economics of Technological Change

1592 1701

621 Technological change; innovation; research and development

### 630 Industry Studies

1594 1702

631 Industry studies: manufacturing

632 Industry studies: extractive industries

633 Industry studies: distributive trades

634 Industry studies: construction

635 Industry studies: services and related industries

636 Nonprofit industries: theory and studies

### 640 Economic Capacity

641 Economic capacity

## 700 Agriculture; Natural Resources

1598 1704

### 710 Agriculture

1598 1704

711 Agricultural supply and demand analysis

712 Agricultural situation and outlook

713 Agricultural policy, domestic and international

714 Agricultural finance

715 Agricultural markets and marketing

716 Farm management

717 Land reform and land use

718 Rural economics

### 720 Natural Resources

1603 1709

721 Natural resources

722 Conservation and pollution

723 Energy

### 730 Economic Geography

1607

731 Economic geography

## 800 Manpower; Labor; Population

1607 1714

### 810 Manpower Training and Allocation; Labor Force and Supply

1607 1714

811 Manpower training and development

812 Occupation

813 Labor force

### 820 Labor Markets; Public Policy

1606 1715

821 Labor economics

822 Public policy; role of government

823 Labor mobility; national and international migration

824 Labor market studies, wages, employment

825 Productivity studies: labor, capital, and total factor

826 Labor markets: demographic characteristics

### 830 Trade Unions; Collective Bargaining; Labor-Management Relations

1617 1727

831 Trade unions

832 Collective bargaining

833 Labor-management relations
